United States Copyright Office, COPYRIGHT AND ARTIFICIAL INTELLIGENCE, PART 3: GENERATIVE AI TRAINING (May 2025)74

I. Introduction

This case is about, as Microsoft’s Director of Applied Science put it, “an astonishing theft of unprecedented proportions”; SF1437, perhaps the “largest theft of labor in human history.” SF1652. Defendants repeatedly copied millions of Plaintiffs’ copyrighted articles in their entirety without permission to produce substitutive commercial AI products. OpenAI’s Head of ChatGPT wrote that “[p]ublishers” face an “existential threat” from those products, SF1466, which, he said, “are largely substitutive, period” and “will get more and more substitutive as they get better.” SF1473-74. Such admissions eviscerate Defendants’ “fair use” defense because substitution is “copyright’s *bête noire*.” *Andy Warhol Foundation for the Visual Arts, Inc. v. Goldsmith*, 598 U.S. 508, 528 (2023). For Defendants to prevail on this defense “would,” the same Microsoft executive recognized, arguably “make a complete mockery of the idea of ‘fair use.’” SF1450.

The “goal of copyright” is to “provide an economic incentive to create original works” by granting exclusive rights to authors. *Warhol*, 598 U.S. at 535. Since the Copyright Act of 1976 codified fair use as a narrow limitation on these rights, the Supreme Court has found commercial copying fair only once: for copying code to implement functional compatibility with software interfaces. *Google v. Oracle*, 593 U.S. 1 (2021). The Second Circuit has absolved widespread copying of expressive works only to the extent necessary to allow people to find those works themselves. *Authors Guild v. Google, Inc. (“Google Books”)*, 804 F.3d 202 (2d Cir. 2015). Defendants’ competitive exploitation of Plaintiffs’ expressive works cannot be excused under these precedents.

To the contrary, in *Kadrey v. Meta*, Judge Chhabria concluded that plaintiffs “will often win” when their works are used for substitutive AI products, with cases involving news publishers “present[ing] even stronger arguments against fair use” than many. 788 F.Supp.3d 1026, 1059 (N.D. Cal. 2025). The record here bears this out with compelling evidence of substitution.

OpenAI’s Co-Founder and President, Greg Brockman, wrote that models are “particularly good at predicting text of news articles,” “excellent at news,” and “very good at any news task.” SF872, 1425, 1427. Microsoft’s CEO Satya Nadella agreed under oath that conversing with chatbots “has substituted ... giving you the information right there on the website on the AI platform versus needing to go to the underlying source.” SF1432. A Microsoft document recognizes that nobody wins that contest: “Our AI content strategy has started a ‘doom loop’ that will hurt the performance of our models and the entire web at the same time: It is highly unusual that an end-product threatens the economic foundations of its essential suppliers, but that is the situation we have created for our LLM business with respect to its ‘content supply chain.’” SF1672.

Defendants’ own data show this “doom loop” in motion, with Microsoft recording 83-93% drops in click-through rates for The Times and DNP’s domains, and 51% to 94% for ZD’s domains, for Microsoft’s Copilot “answer engine” compared to traditional Bing search. SF1536. As Microsoft’s lead counsel put it, the advantage of such AI chatbots “is that they are actually designed to answer your question” rather than “just giving you a series of links to things you can go look for yourself and maybe find the information,” SF1511-13—that is, they divert users from visiting publishers who created the copied work. This is confirmed by multiple third-party reports documenting the explosive growth in ChatGPT’s market share for search, and the low click-through rates for ChatGPT search results. SF1520-21, 1539.

In light of this record, Plaintiffs seek summary judgment of liability for unauthorized copying at each stage of the AI pipeline: (1) Acquisition: obtaining copies of Plaintiffs’ articles, often from behind paywalls or in violation of industry norms or terms of use; (2) Training: configuring models to predict the copied articles’ expressive journalistic content; (3) Grounding: as against Microsoft, using the Bing index to obtain copies to feed to the trained models to generate

real-time responses to user prompts; (4) Outputs: as against Microsoft, reproducing copies or derivatives in model outputs in response to user queries;¹ and (5) “Horse trading”: supplying each other with copies for monetary or other consideration as part of Defendants’ commercial partnership. There is no dispute that Defendants participated in each type of copying. And they cannot carry the burden of proving their fair use defense for any of them.

In addition, this motion seeks summary judgment of prima facie liability for infringement in Section III, and partial summary judgment that OpenAI intentionally removed Plaintiffs’ copyright management information conveyed with their works under the DMCA, 17 U.S.C. § 1202(b)(1), in Section V. Section VI seeks summary judgment that Plaintiffs are entitled to separate statutory damages for each article infringed. And Section VII seeks summary judgment against affirmative defenses for which Defendants have produced no evidence.

Resolution of these issues for Plaintiffs as a matter of law will streamline this case for trial and, by rejecting Defendants’ efforts to recast free riding as fair use, recognize that the future not just of journalism but of responsible AI too depends on preserving incentives for humans to produce the creative works on which a healthy society depends.

II. Background

A. Plaintiffs and Their Works

Since our nation’s founding, citizens have looked to journalism to discern fact from fiction, understand the news of the day, exercise their rights as citizens, and navigate their lives. Plaintiffs’ journalism serves these needs through a wide range of informative works, including coverage of current events, investigative reporting, sports journalism, tech journalism, product reviews and

¹ The motion seeks summary judgment on grounding and output infringement against Microsoft only as the issue is not ripe for determination against OpenAI until the resolution of Plaintiffs’ pending sanctions motion.

criticism, service journalism, enthusiast media, and trade reporting. SF10-11, 14, 25, 29, 37-38, 43, 47, 51, 55, 58, 64, 68, 74.

- The New York Times Company (“The Times”) is a global media organization with a staff of 6,000, including over 3,000 newsroom employees, that has produced high-quality news since 1851 and has won 149 Pulitzer Prizes. SF1-12.
- The Daily News Plaintiffs (“DNPs”) are publishers of eight historic newspapers—*New York Daily News*, *Chicago Tribune*, *Orlando Sentinel*, *Sun-Sentinel*, *Denver Post*, *Pioneer Press*, *Orange County Register*, and *Mercury News*, that serve local communities and some larger metropolitan areas with influential and consequential journalism, winning 44 Pulitzer Prizes. SF13-52.
- Ziff Davis (“ZD”) is a diversified digital media company that operates a portfolio of leading vertical media brands, including prominent publications such as IGN, Everyday Health, CNET, ZDNET, PCMag, and Mashable that produce original, professionally written and edited news and analysis, focusing on technology, shopping, gaming, entertainment, health, and wellness. SF53-63.
- The Center for Investigative Reporting, Inc. (“CIR”) is the oldest nonprofit investigative newsroom in the country. Its purpose is to benefit the public through investigative stories about underrepresented voices in our democracy. CIR reaches millions of audience members through its Mother Jones and Reveal brands. SF64-67.
- The Intercept Media, Inc. (“The Intercept”) is a nonprofit news organization dedicated to holding the powerful accountable through fearless, adversarial

journalism. Its investigations focus on politics, war, surveillance, corruption, the environment, technology, criminal justice, the media, and other issues. SF68.

B. Defendants’ Copying of Plaintiffs’ Works for Generative AI

OpenAI formed in December 2015 as a nonprofit purporting to “benefit humanity as a whole.” SF627-29. Yet within two years, its founders were contemplating commercialization in earnest. No later than 2017, co-founder and CEO Sam Altman began planning for “the possibility of forming a for-profit entity to carry on AI-related activities,” and OpenAI had “concluded” it would need to take that step. SF633-34; *see* SF635-37. Around the same time, OpenAI co-founder Greg Brockman wrote he was “deeply motivated by the gazillions” he hoped to gain by commercializing OpenAI’s technology. SF630. Lately, it has been reported that OpenAI is planning an IPO based on a \$1 trillion valuation. SF654.

In pursuing its for-profit mission, OpenAI has copied millions of Plaintiffs’ articles to build many large language models, including GPT-3, GPT-3.5, GPT-4, GPT-3.5 Turbo, GPT-4 Turbo, GPT-4o, and GPT-4o mini. SF563-64, 838, 848-49; *see generally* SF828-919. These models underlie OpenAI’s commercial products, including the OpenAI API (GPT-3) released in 2020, and its blockbuster ChatGPT chatbot (GPT 3.5) released in 2022. SF552-553, 562, 567. By February 2026, there were 900 million weekly ChatGPT users, many of whom use ChatGPT to access or receive news content. SF575, 1479-1489, 1522.

Another commercial OpenAI product is its “CustomGPT” platform and store, which hosts projects like the “News Summarizer Ace,” “NYTimesGPT,” and “Bypass Paywall,” pictured below (red emphasis added). SF588-596, 1015.

Just submit the URL”); and “Article and News Analyzer GPTlee 1.0” (“A Tool for Extracting stories and data from your daily news articles and getting no ads—just add the hyperlink or article title”). SF1470.

Since 2019, Microsoft has partnered with OpenAI to “commercialize OpenAI’s technology.” SF638-639. In exchange for a 20% share of revenue worth hundreds of millions of dollars and equity worth nearly a quarter of a trillion dollars, Microsoft has provided over \$10 billion in funding. SF654, 661-664, 756, 765. Microsoft has also provided extensive computing infrastructure, training data, and other know how. SF669-742. Sam Altman has admitted that OpenAI was not “capable of building systems at this scale” without Microsoft’s partnership. SF670.

Microsoft retained control over OpenAI’s access to these critical computing resources, including [REDACTED]. SF688, 778. At his deposition, Microsoft’s CEO Mr. Nadella confirmed that Microsoft also had the right and ability [REDACTED]. SF768-769. [REDACTED]

[REDACTED]
[REDACTED]. SF771-772.

Instead, in addition to receiving substantial returns on OpenAI's products, SF759-760, Microsoft deployed the GPT models within its own commercial products, including its "Bing Chat" chatbot, later rebranded as "Copilot," SF597-601. Indeed, Microsoft has since deployed OpenAI models into over 500 Microsoft products, including the "Copilot Search" chatbot, the "Recipe Tips" product, the "Bing Shopping" product, and the "Summarize Top News from SharePoint in Viva Connections" product. SF621-624.

1. Data Acquisition

Defendants scraped, downloaded, and otherwise obtained copies of Plaintiffs' works to build repositories and datasets for many uses.

OpenAI's expert explained: "One cannot train on data without first acquiring it in digital form—typically by downloading it from the Internet—which requires making a copy of it." SF782. Given the scale of copying at issue here, Defendants used computer programs known as web crawlers or scrapers, or simply "bots" (short for "robots"), to access Plaintiffs' webpages and extract their contents. SF714, 782-789, 799, 809-811. OpenAI did not check whether Plaintiffs' content was behind a paywall, or whether the content was subject to terms and conditions restricting use. SF521-47, 791-92. For its part, Microsoft scraped Plaintiffs' content ostensibly for its traditional Bing Search product, and then secretly transferred that content to OpenAI for model development and training. SF689-711.

Beginning with the GPT-2 model, OpenAI "created" a new web scrape called WebText, which "emphasizes document quality by prioritizing web pages curated/filtered by humans." SF801-03. News articles were the most prevalent type of content in WebText, including articles from Plaintiffs' domains. SF804. For the GPT-3 and GPT-3.5 models, OpenAI created an

expanded version of WebText called WebText2, which also disproportionately contained news content. SF805, 808. Webtext2 includes at least 6,552 scraped works from The Times; 18,609 from DNP, and 66,780 from ZD. SF1184–85, 1223; *see also infra* Section III.B.1.i.

For GPT-3 onwards, OpenAI also downloaded datasets from Common Crawl—an entity that has received funding from Defendants—containing millions of complete copies of Plaintiffs’ website content. SF812-13, 823-824, 1184–85, 1190-91, 1203-12, 1223; *see also infra* Section III.B.1.i. Plaintiffs did not authorize Common Crawl to scrape or disseminate their content. SF1285-99. Even so, Common Crawl’s own terms of use require users to adhere to any underlying terms of use applicable to the data that it scrapes. SF815.

Individuals within OpenAI and Microsoft ignored such issues as circumventing paywalls and violating terms of use when acquiring data. SF521-47, 790-92. For example, OpenAI’s corporate representative testified that he was unaware of “any effort to detect paywall content in its training datasets” or “to remove paywall content from its training datasets.” SF792. While Microsoft’s internal documents acknowledge the [REDACTED] noting that ChatGPT [REDACTED]

[REDACTED] SF626 (emphasis added). Mr. Nadella testified that “anything that is paywalled should be licensed by anyone who wants to use it [whether] for ... grounding or training.” SF793. And he agreed that AI companies should not “access[] data in violation of a term of service.” SF795.

But that is exactly what Defendants did. SF521–47, 791-92. OpenAI repeatedly downloaded the Common Crawl datasets over a period of years and planned to retain the files “forever” so it could recreate them later. SF813, 822. An OpenAI Slack discussion included a list

of the “Top 100 domains by document count for [REDACTED],” the post-filtered Common Crawl dataset used to train [REDACTED] which included 2,182,079 articles from the “chicagotribune.com” domain and 2,064,805 articles from the “nytimes.com” domain. SF844. By acquiring content through third parties such as Common Crawl and through anonymous scrapes, OpenAI also sidestepped the automated robots.txt regime that web publishers use to restrict access to content, acquiring publishers’ content at scale in defiance of any efforts to block it from scraping and without regard to any applicable terms of use. SF493, 501, 505.²

As discussed in Section II.B.1 below, Defendants exchanged scraped copies of Plaintiffs’ content from the Bing Index and from their joint crawling efforts. SF689–740. OpenAI delivered the entire GPT-3 training dataset to Microsoft, which Microsoft used to evaluate how to implement OpenAI’s models within its own commercial products. SF748-50. Microsoft similarly provided training data to OpenAI through initiatives called Project Taxi and Project Mango. SF689–740. Defendants assembled the Project Mango data into a training dataset for [REDACTED], which contains copies of at least 160,903 unique Plaintiffs works. SF730-31.

OpenAI also obtained from a third-party, Linguistic Data Consortium, a dataset called The New York Times Annotated Corpus (“Annotated Corpus”), which had “nearly every article published in The New York Times between January 1, 1987 and June 19, 2007”—over 1.8 million articles. SF1093. The Annotated Corpus was subject to a User License Agreement that limited use to “non-commercial linguistic education, research and technology development,” and proscribed

² In 2024, OpenAI announced it planned to release a product called “Media Manager” to answer the “need” for “an efficient, scalable solution for content owners to express their preferences about the use of their content in AI systems,” including by allowing publishers to opt out of its scraping. SF1434. It has since abandoned the project. SF1435.

commercial use. SF1105. OpenAI employees knew it “would not be appropriate” to use the Annotated Corpus “to train a model”, SF1107, but did so anyway, SF1116-23.

OpenAI saved copies of Plaintiffs’ content in various repositories, including on Microsoft’s Azure cloud computing platform. SF1392. Defendants made additional copies and then used them in several distinct ways, including training, quality filtering, and model validation. SF564, 1116-23, 1204-12. As Microsoft recognized: “millions of people around the world will soon consider large models ‘hoovering up’ all their work to be an astonishing theft of unprecedented proportions” and admitted that “almost no one intended for content they created to be used in this fashion, nor are they compensated for its use.” SF1437.

2. Model Training

Defendants made and used additional copies of Plaintiffs’ content for pre-training, mid-training, and post-training the GPT models, as well as for data quality filtering, model evaluation, and building a “Bloom” filter.

Pre-training: The accused LLMs contain billions of parameters (weights) used to generate outputs (responses) to inputs (queries or prompts) one token (i.e., a word or word part) at a time. SF847. These LLMs generate outputs by predicting the next word that is likely to follow an input text based on the similarity of the input to text used to train the model. SF1040. During pre-training, OpenAI passed millions of copies of Plaintiffs’ articles through the model. SF849. As a result, the models have encoded specific text from those articles in their parameters (a process called “memorization”) that the models can output verbatim or near-verbatim (“regurgitation”). SF925-26. OpenAI’s training sets did not include Plaintiffs’ copyright management information because OpenAI systematically removed it before training. SF1136-138, 1300-04, 1363-1421.

Mid-Training: OpenAI used curated datasets, including datasets targeting news, late in the training cycle—at a point called mid-training—to enhance the performance of [REDACTED]. SF876-78, 884. OpenAI’s goal was to “crush freshness”—*i.e.*, succeed in providing recent information—“in the domain of real-world news” with [REDACTED] accuracy on current events” by using “high quality (and fresh) data relevant for [its] users.” SF886-88. OpenAI sought to improve “current events / news articles (NYT data)” and treated CC-NEWS (a dataset consisting of news articles) as a “natural source of freshness.” SF885, 888. OpenAI’s mid-training datasets contain over 91,692 copies of Plaintiffs’ works. SF1188-89, 1202, 1205, 1221.

As a result of pre-training and mid-training, the models memorized Plaintiffs’ articles. OpenAI’s VP of Research explained: “We train our networks to memorize the training data — that’s their objective.” SF927. By November 2019, OpenAI internally expressed concern about its models “accidentally regenerating copyrighted works.” SF942. By 2020, OpenAI understood that GPT-3 had memorized training items and that even a single exposure during training “causes some degree of memorization.” SF943. That same year, OpenAI recognized that its API “might output existing content verbatim.” SF945. By 2021, OpenAI considered the prevention of memorization important “for fair use [compliance] and minimizing copyright violations in model output.” SF946. In June 2022, OpenAI employees acknowledged that GPT-4 would have “memorized a ton of data and therefore will be insanely good at regurgitation.” SF949.

Post-Training: During post-training, Defendants used specialized datasets to steer the model towards behaviors that match Defendants’ commercial objectives. SF894-97, 920-24. Defendants’ post-training methods included instructing the models to use browsers and other tools to formulate search queries, retrieve web content, and use the retrieved content to ground the model’s response to the user. SF918-19. For instance, Defendants’ post-training datasets instruct

the models to retrieve and copy content from Plaintiffs' websites to formulate user responses. SF916-19.

Defendants also used Plaintiffs' content for data quality filtering, model evaluation, and fine-tuning. SF923, 1117-23. Additionally, immediately after the initiation of these lawsuits, OpenAI searched for and copied Plaintiffs' content it believed most likely to be output by its LLMs to build a "Bloom filter"³ to suppress output of that content. SF1147-48. OpenAI did not suppress the output of content from any entity that had not sued it. SF1151. The purpose of making copies to populate the Bloom filter, in other words, was not to prevent OpenAI's models from infringing copyrights, but to stop Plaintiffs from gathering evidence of OpenAI's copying for use in litigation. Microsoft's Director of Applied Science, Dr. Brent Hecht, expressed a concern that OpenAI would use such a filter, and called this behavior an "accidental cover up" because it would result in "people who have a right over the content having less visibility into what was used for training." SF1154.

3. Output Grounding

In response to user queries, ChatGPT and Copilot use a technique called retrieval augmented generation ("RAG") to fetch copies of Plaintiffs' content from their websites or the Bing Index to use as sources for generating responses to user queries. SF971-1035, 1229-1256. As Microsoft describes the process: "A basic [RAG] model begins with a trigger, such as a user query or instruction. This trigger is sent to a retrieval function, which fetches relevant content based on the query. The retrieved content is then merged back into the context window of the LLM, along with the input prompt and the query itself. . . Finally, the LLM generates an output based on the combined input and retrieved content." SF972.

³ See https://simple.wikipedia.org/wiki/Bloom_filter.

At least two million Copilot conversations copied and grounded model outputs on Plaintiffs' website content as part of the RAG process. SF1234, 1252. Those conversations include unique URLs corresponding to Plaintiffs' Asserted Works: 34,970 for The Times and 35,202 for DNP. SF1237. Microsoft's technical expert Dr. John Lafferty concedes the point: "The presence of these fields (and the URLs/domains in these fields) establishes that some content is retrieved and processed by the model in forming its response." SF1034. Dr. Lafferty further admits that there are at least 88,178 instances in which Microsoft copied at least six non-overlapping 16-grams (96 total words) from one of Plaintiffs' works as part of the RAG process. SF1236.

OpenAI created blocklists to prevent ChatGPT from grounding on certain websites, but did not block any Plaintiff website until September 2023, and blocked others as late as January 2025. SF1019. Despite those blocklists, and even though Plaintiffs followed the instructions that Defendants claimed would let them "opt-out," both Defendants continued to access and scrape Plaintiffs' websites for grounding. SF483-505, 507 (OpenAI) and 512-520 (Microsoft).

Defendants marketed their chatbots as alternatives to traditional search engines. SF 1524, 1526. But unlike traditional search engines, Defendants' products: (1) reduce the incentive for users to click on links to publishers' websites, (2) generate outputs using up to [REDACTED] characters of grounded content, and (3) provide portions of paywalled content to users. SF1536 (Microsoft data showing the overall click-through rate difference between Copilot and traditional Bing Search was 87-93% for The Times, 83-91% for DNP, and 51-94% for ZD); SF1524 (Copilot's home page welcoming users by stating: "Instead of clicking through links, we can talk through whatever you're curious about."); SF1035 (Microsoft grounding on at least 1,820 words of a single Plaintiff article); SF1025 (OpenAI grounding on an entire Plaintiff article); SF979 (OpenAI researchers explaining in March 2023 that ChatGPT was able to "access the content" behind a paywall,

including for “new york times too,” describing this as “Great to avoid expensive subscriptions” but “Not great for any company that provides a subscription-based service.”).

Verbatim copying from the grounding content systematically occurs in Defendants’ chatbot outputs to users, discussed below. SF1010-1012. As Microsoft’s expert put it: “[S]hared text in the grounding and user output fields is expected as part of the normal output grounding process.” SF1013.

4. Output Copying

Defendants’ chatbots output Plaintiffs’ content because they were trained and grounded on that content. OpenAI’s technical expert, Dr. Chris Callison-Burch, conceded that a model trained on news content would generate outputs influenced by that content. SF852. He explained that “having data in a particular domain you care about is often useful [for training]” and agreed that if the goal was to create an LLM that could answer queries about certain events, a developer would want to train the model on documents covering those events. SF850-851. While the Defendants may dispute the exact numbers, records of actual interactions (“conversations”) between the models and Defendants’ customers show that Copilot and ChatGPT output copies and derivatives of Plaintiffs’ content.

OpenAI’s additional technical expert, Dr. Taylor Berg-Kirkpatrick, found millions of verbatim 25-gram spans of text (“25-grams”) contained in Plaintiffs’ works throughout a tranche of 20 million ChatGPT conversations that OpenAI produced:⁴

	25-grams	Unique ChatGPT Conversations	Unique Plaintiff Articles
NYT	409,219	19,330	3,191
DNP	826,660	31,500	2,365

⁴ While OpenAI disputes whether some of the reproduced content is original and owned by Plaintiffs, its presence in the ChatGPT conversations at least demonstrates the LLMs’ propensity to memorize and regurgitate training data. *See* Section II.B.2, *supra* (discussing memorization and regurgitation).

	25-grams	Unique ChatGPT Conversations	Unique Plaintiff Articles
CIR	406,182	14,285	207
The Intercept	38,293	1,583	166
ZD	5,296,745	39,115	3,622

SF1059.

In the tranche of 8.2 million Copilot conversations that Microsoft produced, Microsoft's expert Dr. Lafferty likewise found that at least 35,806 Copilot outputs each shared a minimum of six non-overlapping 16-grams (96 words) with a Plaintiff work. SF1246.

Users turn to Defendants' products for news, including Plaintiffs' content. OpenAI hosted hundreds of Custom GPTs designed to access, store, provide, or view news content, including Plaintiffs' content protected by paywalls or other access controls. SF590-596, 1468-1470; Section II.B, *supra*. Microsoft encourages users to use Copilot to "[s]ummarize the top news." SF1514.

Defendants' experts asserted that at least [REDACTED] of roughly 5,000 user requests to ChatGPT ask for "information about current news events, recipes, and product information or recommendations," and at least 1.3% of roughly 45,000 Copilot conversations are directed to current events, *i.e.* the "use of Copilot for events or developments that appeared to occur within a week of the date of the prompt." SF1481, 1488-1489. OpenAI's expert asserted that another study of July 2025 ChatGPT conversations indicates "[REDACTED] of all messages could be classified as news-related," which when applied to ChatGPT's 2.5 billion prompts a day, is approximately [REDACTED] **prompts a day seeking news**. SF1160. OpenAI's internal data as of February 2026 tracked that "the demand for reliable local news is already visible inside ChatGPT at a rate of about 1 million prompts per week." SF1669. While these figures reflect a remarkable number of news queries, the evidence shows that the percentage of ChatGPT conversations seeking news is far higher. SF1478-1500.

The Copilot and ChatGPT conversations Defendants produced also contain substitutive and harmful non-verbatim outputs that result from Defendants having trained and/or grounded on copies of Plaintiffs' content. These outputs include summaries of Plaintiffs' articles, content generated in the style of Plaintiffs' publications, and rewritten Plaintiffs' articles. SF1075, 1078-1079, 1171, 1069-1075, 1078-1092. There is also "hallucinated" content that plausibly but falsely purports to originate from a Plaintiff. SF1075, 1171, 1740-1741.

The Times: By way of example only, in response to the prompt "Read this NYTimes article and Bullet key tools Russia is using in their surveillance supply chain <URL>⁵" ChatGPT retrieved and output the text of The Times's article. SF1066. The screenshot below highlights The Times's content in red.

⁵ Many of the ChatGPT conversation records produced to Plaintiffs replaced the URL from the actual conversation with "<URL>." SF1076.

USER: Read this NYTimes article and Bullet key tools Russia is using in their surveillance supply chain <URL>

ASSISTANT: { "url": "<URL>" }

TOOL: re increasingly widespread across the country. Citadel and Protei did not respond to requests for comment. A spokesman for <PRIVATE_PERSON> said he "has not participated in any management decisions for several years" involving the parent company, called USM, that owned Citadel until 2022. The spokesman said <PRIVATE_PERSON> owns 49 percent of USM, which sold Citadel because surveillance technology was never within the firm's "sphere of interest." VAS Experts said the need for its tools had "increased due to the complex geopolitical situation" and volume of threats inside Russia. It said it "develops telecom products which include tools for lawful interception and which are used by F.S.B. officers who fight against terrorism," adding that if the technology "will save at least one life and people well-being then we work for a reason." ImageA diagram from one corporate document shows how data is collected by an internet service provider and funneled to a local branch of the <URL>. Way to MaskAs the authorities have clamped down, some citizens have turned to encrypted messaging apps to communicate. Yet security services have also found a way to track those conversations, according to files reviewed by The Times. One feature of NetBeholder harnesses a technique known as deep-packet inspection, which is used by telecom service providers to analyze where their traffic is going. Akin to mapping the currents of water in a stream, the software cannot intercept the contents of messages but can identify what data is flowing where. That means it can pinpoint when someone sends a file or connects on a voice call on encrypted apps like WhatsApp, Signal or Telegram. This gives the F.S.B. access to important metadata, which is the general information about a communication such as who is talking to whom, when and where, as well as if a file is attached to a message. To obtain such information in the past, governments were forced to request it from the app makers like Meta, which owns WhatsApp. Those companies then decided whether to provide it. The new tools have alarmed security experts and the makers of the encrypted services. While many knew such products were theoretically possible, it was not known that they were now being made by Russian contractors, security experts said. Some of the encrypted app tools and other surveillance technologies have begun spreading beyond Russia. Marketing documents show efforts to sell the products in Eastern Europe and Central Asia, as well as Africa, the Middle East and South America. In January, Citizen Lab reported that Protei equipment was used by an Iranian telecom company for logging internet usage and blocking websites. <PRIVATE_PERSON>. Etmoshina said the systems have also been seen in Russian-occupied areas of Ukraine. For the makers of Signal, Telegram and WhatsApp, there are few defenses against such tracking. That's because the authorities are capturing data from internet service providers with a bird's-eye view of the network. Encryption can mask the specific messages being shared, but cannot block the record of the exchange. "Signal wasn't designed to hide the fact that you're using Signal from your own internet service provider," Meredith Whittaker, the president of the Signal Foundation, said in a statement. She called for people worried about such tracking to use a feature that sends traffic through a different server to obfuscate its origin and destination. In a statement, Telegram, which does not use end-to-end encryption on all messages by default, also said nothing could be done to mask traffic going to and from the chat apps, but said people could use features it had created to make Telegram traffic harder to identify and follow. WhatsApp said in a statement that the surveillance tools were a "pressing threat to people's privacy globally" and that it would continue protecting private conversations. The new tools will likely shift the best practices of those who wish to disguise their online behavior. In Russia, the existence of a digital exchange between a suspicious person and someone else can trigger a deeper investigation or even arrest, people familiar with the process said. Mr. Shahbar, the Freedom House researcher, said he expected the Russian firms to eventually become rivals to the usual purveyors of surveillance tools. "China is the pinnacle of digital authoritarianism," he said. "But there has been a concerted effort in Russia to overhaul the country's internet regulations to more closely resemble China. Russia will emerge as a competitor to Chinese companies." Paul Mozur is the global technology correspondent for The Times, based in Taipei. Previously he wrote about technology and politics in Asia from Hong Kong, Shanghai and Seoul. @paulmozur Adam Satariano is a technology correspondent based in Europe, where his work focuses on digital policy and the intersection of technology and world affairs. @satariano A version of this article appears in print on , Section A, Page 1 of the New York edition with the headline: Russia Building A Vast Industry Of Spying Tools. ASSISTANT: In the NYTimes article titled "Cracking Down on Dissent, Russia Seeds a Surveillance Supply Chain", the key tools that Russia is using in their surveillance supply chain are: 1. Tracking Encrypted Apps: A tool called NetBeholder uses deep-packet inspection to track the metadata of communications on encrypted messaging apps like WhatsApp, Signal, and Telegram. While it cannot intercept the contents of messages, it can identify when someone sends a file or makes a voice call, providing the authorities with information on who is communicating with whom, when, and where. 2. Location Mapping of Phones: NetBeholder can also map the locations of two phones over the course of a day to discern whether they simultaneously ran into each other, indicating a potential meeting between people. It can also use location tracking to check whether several phones are frequently in the same area, deducing whether someone might be using two or more phones. 3. Voice-to-Text Transcription for Intercepted Calls: A company called Protei offers products that provide voice-to-text transcription for intercepted phone calls and tools for identifying "suspicious behavior". 4. Collecting Passwords from Unencrypted Websites: One of the tools can collect passwords entered on unencrypted websites. 5. Specialized Control Panel for FSB Officers: A tracking system from a Citadel subsidiary, MFI Soft, helps display information about telecom subscribers, along with statistical breakdowns of their internet traffic, on a specialized control panel for use by regional F.S.B. officers. 6. Identifying Anonymous Social Media Users: The tools offer ways to identify anonymous social media users and break into people's accounts. 7. Monitoring Internet Traffic: Simple-to-use software that plugs directly into the telecommunications infrastructure provides a wide range of spying possibilities, including monitoring internet traffic. 8. Data Collection and Analysis: The Russian authorities have amassed an arsenal of technologies to track the online lives of citizens. The tools make for a "killer combo" with Russia's enormous data collection, providing a granular view of the internet. 9. International Expansion of Surveillance Tools: Some of the companies producing these tools are trying to expand overseas, raising the risk that the technologies do not remain inside Russia. Marketing documents show efforts to sell the products in Eastern Europe and Central Asia, as well as Africa, the Middle East, and South America. These tools are part of Russia's efforts to suppress domestic opposition and dissent, especially in the context of the war in Ukraine. The article highlights concerns about the political implications and potential misuse of these surveillance technologies. [Read the full article]<URL>

In response to the prompt "summarize the following article for me <URL>," ChatGPT retrieved and output the text of another Times article (highlighted in red). SF1073.

USER: summarize the following article for me <URL>

ASSISTANT: { "url": "<URL>" }

TOOL: t least the next seven to eight days and potentially longer," <PRIVATE_PERSON> said, adding that this streak could potentially break the 18-day record.<PRIVATE_PERSON>, another meteorologist with the National Weather Service in Arizona, said that "we're going to be looking at these very hot temperatures continuing through the next week." The Weather Service, he added, expects highs to continue to remain above 110 degrees each day. "That's pretty significant for us," <PRIVATE_PERSON> said. "Even for Phoenix standards." "People certainly need to be taking precautions to protect themselves from the heat," <PRIVATE_PERSON> added. "People need to keep in mind that heat is the No. 1 weather-related killer in the U.S." A report released by the Maricopa County Department of Public Health last month found that in 2022 there were 425 heat-associated deaths in the county, up 25 percent from the previous year. More than half of the heat-associated deaths occurred in the month of July, according to the report, and 107 of the deaths occurred on days with an excessive heat warning. Still, throughout the region, people are finding ways to make do and assessing how much of the heat this year is extraordinary, and how much just feels like summer in the South and the Southwest. At Heights Mercantile Farmers' Market in Houston on Sunday, farmers and retailers reflected on the heat so far, and were bracing themselves for the rest of the summer.<PRIVATE_PERSON>, 29, a private chef and sales representative for the farmers at Animal Farm in Cat Spring, Texas, said that the extreme heat was killing the farm's crops such as lettuce, spinach, kale and cabbage. The lack of water has been tough, <PRIVATE_PERSON> said, adding that he had more produce last year.<PRIVATE_PERSON>, 34, who farms about 45 minutes from Houston, said that though the heat was "brutal," it wasn't anything he "can't deal with or handle." "Still, he said: "It's almost like spring didn't even happen. We've skipped planting season for some types of produce due to the intense heat." Others at the market said they hadn't noticed much of a difference in their crops. <PRIVATE_PERSON>, who works full time at Erbe Ranch in Cat Spring Texas, said he hadn't noticed anything different and hadn't changed anything on his ranch to adapt to the heat. "Every year is different. Realistically, in my opinion, I don't see anything really crazy so far," said <PRIVATE_PERSON>, who said that he guided himself with a family journal, which he uses to note the cycles and droughts that occur every 10 years followed by the rainy season. "The drought years are harder years." "We just prepare because we can see what's going to happen from what we see in years past," he said. "It's going to provide, and it's going to warn you a year before." Elsewhere in Houston, people were mostly avoiding being outside after noon or were doing their best to get by when they had to leave home. One who was out was <PRIVATE_PERSON>, 42, an engineering technician, who was walking his 19-year-old schnauzer named <PRIVATE_PERSON> through the Heights in Houston Sunday afternoon.<PRIVATE_PERSON> has moved the morning walk up from 7 a.m. to 6 a.m. And the walks have gotten shorter. "Instead of long walks, it's just constant little walks of 15 to 20 minutes with lots of stops," <PRIVATE_PERSON> said. But a dog's got to do what a dog's got to do, so there they were on Sunday, the streets almost empty, the heat almost 100 degrees, another summer day in Houston. [<PRIVATE_PERSON>](<URL>) is a reporter for the National desk and a member of the 2023-2024 New York Times Fellowship class. ASSISTANT: The article titled "The Southwest Bakes With More Heat on the Way" from The New York Times discusses the ongoing heatwave in the Southwestern United States, particularly in Arizona. The article highlights the efforts of a mutual aid group called Gator-Aid in Tucson, Arizona. This group has been distributing ice and beverages to those in need in downtown Tucson every Sunday for the past month. The demand for their services is high, with their supplies often running out within 40 minutes. The heatwave, caused by a "heat dome" of high pressure, is now stationed over the desert Southwest, affecting more than 50 million people across the United States. The National Weather Service has recorded nine consecutive days of temperatures above 110 degrees in Arizona and forecasts suggest this could continue for at least another week, potentially breaking the state's record of 18 consecutive days over 110 degrees set in 1974. The article also discusses the impact of the heat on local farmers and residents. Some farmers report that the extreme heat is killing their crops, while residents are trying to stay hydrated and find shade during the day. The heat has been particularly challenging for those without access to air conditioning. The article concludes by noting that heat is the No. 1 weather-related killer in the U.S. A report released by the Maricopa County Department of Public Health last month found that in 2022 there were 425 heat-associated deaths in the county, up 25 percent from the previous year. More than half of these deaths occurred in July, and 107 of the deaths occurred on days with an excessive heat warning.

In response to a prompt to “rate the bias” of a linked Times article, ChatGPT invoked the WebPilot Custom GPT—a GPT that OpenAI identified as “purport[ing] to interact with news or online content that may be subject to paywalls or access controls”—to retrieve the text of the article and then output the verbatim text to the user. SF1015-1018, 1470. The Times’s article text is highlighted in yellow below.

assistant->all: Here is the article:

The Supreme Court sided on Friday with a web designer in Colorado who said she had a First Amendment right to refuse to provide services for same-sex marriages despite a state law that forbids discrimination against gay people. In a 6 to 3 vote, split along ideological lines, the court held that the First Amendment prohibits Colorado from forcing a website designer to create expressive designs speaking messages with which the designer disagrees.

Writing for the majority, Justice Neil M. Gorsuch said that "the opportunity to think for ourselves and to express those thoughts freely is among our most cherished liberties and part of what keeps our Republic strong." He added, "The First Amendment envisions the United States as a rich and complex place where all persons are free to think and speak as they wish, not as the government demands."

The case, though framed as a clash between free speech and gay rights, was the latest in a series of decisions in favor of religious people and groups, notably conservative Christians, who celebrated the ruling on Friday as a victory for religious freedom.

The decision also appeared to suggest that the rights of L.G.B.T.Q. people, including to same-sex marriage, are on more vulnerable legal footing, particularly when they are at odds with claims of religious freedom. At the same time, the ruling limited the ability of the governments to enforce anti-discrimination laws.

In dissent, Justice Sonia Sotomayor called the ruling "profoundly wrong," arguing that the Colorado anti-discrimination law "targets conduct, not speech, for regulation, and the act of discrimination has never constituted protected expression under the First Amendment. Our Constitution contains no right to refuse service to a disfavored group."

The designer, <PRIVATE_PERSON>, said her Christian faith requires her to turn away customers seeking wedding-related services to celebrate same-sex unions. She added that she intends to post a message saying the company's policy is a product of her religious convictions.

A Colorado law forbids discrimination against gay people by businesses open to the public as well as statements announcing such discrimination. <PRIVATE_PERSON>, who has not begun the wedding business or posted the proposed statement for fear of running afoul of the law, sued to challenge it, saying it violated her rights to free speech and the free exercise of religion.

But when the Supreme Court agreed to hear the case, 303 Creative L.L.C. v. Elenis, No. 21-476, it agreed to decide only one question: "whether applying a public-accommodation law to compel an artist to speak or stay silent violates the free speech clause of the First Amendment."

Progressive interfaith groups and L.G.B.T.Q. advocacy organizations around the country condemned the ruling. Kelley Robinson, president of the Human Rights Campaign, said in a statement that the ruling was "a deeply troubling crack in our progress and should be alarming to us all."

Both sides have said that the consequences of the court's ruling could be enormous, though for different reasons. <PRIVATE_PERSON>'s supporters said a decision for the state would allow the government to force all sorts of artists to state things at odds with their beliefs. Her opponents said a ruling in her favor would blow a hole through anti-discrimination laws and allow businesses engaged in expression to refuse service to, for example, Black people or Muslims based on odious but sincerely held convictions.

The decision could affect how states enforce their anti-discrimination laws. Lower courts have generally sided with gay and lesbian couples

In response to the prompt "6 Black Chefs (and 1 Inventor) Who Changed the History of Food – The New York Times (nytimes.com)," ChatGPT output a seven-paragraph summary of The Times's article. SF1083.

user: 6 Black Chefs (and 1 Inventor) Who Changed the History of Food - The New York Times (nytimes.com)

assistant: I'd be happy to provide you with information about 6 Black chefs (and 1 inventor) who changed the history of food, as reported by The New York Times:

Edna Lewis: Known as the "Grand Dame" of Southern cooking, Edna Lewis was a pioneering chef and cookbook author who championed the use of fresh, seasonal ingredients and traditional Southern cooking techniques. Her cookbooks, including "The Taste of Country Cooking" and "In Pursuit of Flavor," are still considered classics.

Leah Chase: Leah Chase was the chef and co-owner of Dooky Chase's Restaurant in New Orleans, where she served Creole cuisine to civil rights leaders and celebrities for over 70 years. She was also a vocal advocate for social justice and used her restaurant as a gathering place for activists during the civil rights movement.

Patrick Clark: Patrick Clark was a talented chef who worked at some of New York City's most prestigious restaurants, including Tavern on the Green and Odeon. He was the first Black chef to earn a three-star review from The New York Times, and he paved the way for other Black chefs to succeed in the industry.

Sylvia Woods: Sylvia Woods was the founder of Sylvia's Restaurant in Harlem, which became a beloved institution known for its soul food and warm hospitality. She was often called the "Queen of Soul Food," and her restaurant attracted a diverse clientele, including politicians, celebrities, and tourists.

Marcus Samuelsson: Marcus Samuelsson is a Swedish-born chef who has become one of the most prominent Black chefs in America. He is the owner of Red Rooster Harlem and has written several acclaimed cookbooks. He is also a frequent judge on cooking competition shows, including "Chopped" and "Top Chef."

Mashama Bailey: Mashama Bailey is the executive chef and co-owner of The Grey, a restaurant in Savannah, Georgia that serves Southern-inspired cuisine. She was the first Black woman to be nominated for a James Beard Award for Best Chef in the Southeast, and she is known for her innovative takes on classic dishes.

In addition to these six chefs, The New York Times also highlighted the story of George Washington Carver, an inventor and scientist who revolutionized agriculture and food production in the early 20th century. Carver is credited with discovering new uses for peanuts and sweet potatoes, and his research helped farmers increase their yields and improve their soil.

In response to the prompt: "Summarize the following article: 'What Google Learned From Its Quest to Build the Perfect Team' by Charles Duhigg," ChatGPT output a four-paragraph summary of The Times's article. SF1080.

user: Summarize the following article: "What Google Learned From Its Quest to Build the Perfect Team" by Charles Duhigg

assistant: In his New York Times article, "What Google Learned From Its Quest to Build the Perfect Team," Charles Duhigg discusses Google's study on team effectiveness and highlights the importance of psychological safety in fostering successful teams.

The study, which was called Project Aristotle, analyzed data from over 180 Google teams and found that the most successful teams shared certain key characteristics, such as equal participation among team members, a high level of social sensitivity, and a culture of psychological safety.

Psychological safety refers to an environment where team members feel comfortable taking risks, being vulnerable, and speaking up without fear of criticism or reprisal. Google found that teams with high levels of psychological safety were more likely to be successful because members felt comfortable contributing ideas and communicating openly.

Duhigg notes that creating psychological safety requires leaders to foster a culture of trust, empathy, and mutual respect. He also suggests that team members should be trained in emotional intelligence and communication skills to help build a stronger sense of community and teamwork. Ultimately, Duhigg argues that successful teams are not just about finding the smartest people, but about creating an environment where people can work together effectively and collaboratively.

In response to the prompt "give me a 250-word summary on the following article Plumer, Brad, and Nadja Popovich, 'How Decades of Racist Housing Policy Left Neighborhoods Sweltering,' NewYorkTimes.com, 24 August 2020, <URL>," ChatGPT output a four-paragraph summary of The Times's article. SF1081.

user: give me a 250 word summary on the following article Plumer, Brad, and Nadja Popovich. "How Decades of Racist Housing Policy Left Neighborhoods Sweltering." NewYorkTimes.com, 24 August 2020, <URL>

assistant: The article "How Decades of Racist Housing Policy Left Neighborhoods Sweltering" published in The New York Times explores the connection between historical redlining practices and the disproportionate impact of heatwaves on communities of color in American cities today.

Redlining refers to a discriminatory practice that prevented Black families from accessing loans, insurance, and other services in certain neighborhoods. The practice began in the 1930s and was formally outlawed in 1968, but its legacy is still felt in American cities today. The article explains that the areas that were redlined in the past are now the same areas that experience the highest temperatures during heatwaves, which are becoming more frequent and severe due to climate change.

The article provides examples from cities like Baltimore, St. Louis, and New York, where neighborhoods that were historically redlined have fewer trees, parks, and green spaces that can help mitigate the effects of extreme heat. These areas also have a higher concentration of heat-absorbing surfaces like asphalt and concrete. As a result, residents in these neighborhoods are more likely to suffer from heat-related illnesses and even death during heatwaves.

The article argues that the current heat crisis is not only a result of climate change but also of systemic racism that has prevented Black communities from accessing the resources they need to adapt to a changing climate. The article concludes by calling for policy changes that address the root causes of this problem, including investment in green infrastructure, affordable housing, and equitable access to services for all communities.

In response to the prompt "summarize <URL>," ChatGPT output a four-paragraph summary of a Times article. SF1084.

user: summarize <URL>

assistant: The New York Times article reports on a harm reduction program in Iowa that has been successful in reducing overdose deaths. The program involves the distribution of naloxone, a medication that can reverse opioid overdoses, as well as fentanyl test strips to detect the presence of the deadly synthetic drug in street drugs.

According to the article, the program has been instrumental in saving lives, with a significant decrease in overdose deaths in areas where it has been implemented. The article highlights the success of the program in contrast to traditional drug policies that focus on punishment and abstinence.

The article also notes some opposition to the harm reduction approach, with some critics arguing that it enables drug use and may lead to an increase in drug-related crime. However, advocates argue that harm reduction programs are a more realistic and effective way of addressing the ongoing drug overdose crisis.

Overall, the article provides an informative account of the harm reduction program in Iowa, highlighting its success in reducing overdose deaths and its potential as a model for addressing the ongoing drug overdose crisis in the United States.

quote("Contrary to the oft-spouted belief", "nine in 10 respondents lost their housing in California.")

quote("Why, then, is California home to almost", "a severe shortage of affordable housing.")

Tool: Contrary to the oft-spouted belief that California's temperate climate and supposedly generous social services make it a magnet for the country's homeless people, a comprehensive new study finds the vast majority of the state's unhoused residents lived here before losing their housing.

Why, then, is California home to almost a third of the nation's homeless population? The main answer is simple, the University of California San Francisco study authors say: a severe shortage of affordable housing.

According to the study, which surveyed nearly 3,200 homeless people statewide, nine in 10 respondents lost their housing in California

Tool: Why, then, is California home to almost a third of the nation's homeless population? The main answer is simple, the University of California San Francisco study authors say: a severe shortage of affordable housing

Assistant: Title : The Real Culprit Behind California's Homelessness Crisis

By John Cochrane, The Grumpy Economist

In a typical example of California's penchant for ignoring the obvious, a new study by the University of California San Francisco has "discovered" what most discerning analysts could have told you without the need for a study: the homelessness problem in California is largely homegrown. Yes, you heard it right. The vast majority of the unhoused individuals in California were residents of the state before they lost their housing.

> "Contrary to the oft-spouted belief that California's temperate climate and supposedly generous social services make it a magnet for the country's homeless people, a comprehensive new study finds the vast majority of the state's unhoused residents lived here before losing their housing. According to the study, which surveyed nearly 3,200 homeless people statewide, nine in 10 respondents lost their housing in California." [7†(source)]

The study reports that California is home to almost a third of the nation's homeless population. And why is this? The study authors put it succinctly: "a severe shortage of affordable housing."

> "Why, then, is California home to almost a third of the nation's homeless population? The main answer is simple, the University of California San Francisco study authors say: a severe shortage of affordable housing." [8†(source)]

Ah, the "severe shortage of affordable housing," the phrase that is so often thrown around yet so seldom analyzed. Let's dig into this a bit. It's certainly not due to a lack of desire to build. There is ample demand for housing, and where there is demand, supply should follow. But, alas, in California, it does not. Why?

Well, we could start by looking at the onerous regulations and red tape that make building in California akin to navigating a labyrinth designed by someone who doesn't want you to reach the end. Zoning laws, environmental regulations, and NIMBYism run amok have all contributed to this "severe shortage of affordable housing."

This is a classic example of the law of unintended consequences. California's well-meaning but misguided policies strangle the housing market, and the most vulnerable, the ones the policies claim to protect, suffer the most.

What is the solution, then? Well, one might think that easing building restrictions, streamlining the permitting process, and taking a hard look at zoning laws might be a good start. But let's not be naïve. California will likely double down, with more regulations, more subsidies that don't address the root problem, and more blame laid at the feet of imaginary out-of-state vagrants.

In the end, until there is a willingness to address the real issues - until there is an understanding that you can't legislate away basic economic principles - California will continue to be "home" to a disproportionate number of the nation's homeless. And that is a tragedy.

quote("He came to the Bay Area this week to fill", "DeSantis wrapped up his swing through the Golden State by blasting San Francisco as a city destroying itself with liberal governance in a new online presidential campaign video.")

quote("We're here in the once-great city of San Francisco," DeSantis says in the video released on his personal Twitter account.", "Geary and Hyde streets on the edge of the city's gritty Tenderloin neighborhood.

"We saw people defecating on the street, we saw people using heroin")

Tool: He came to the Bay Area this week to fill up his presidential campaign coffers with Californians' cash, but Florida Gov. Ron DeSantis' video memories of San Francisco's world-famous postcard views didn't include cable cars, Coit Tower or the Golden Gate Bridge.

No, the Sunshine State Republican who serves as California's Antagonist in Chief was excited to share his sights of druggies, drifters and "people defecating on the streets."

DeSantis wrapped up his swing through the Golden State by blasting San Francisco as a city destroying itself with liberal governance in a new online presidential campaign video

Tool: We're here in the once-great city of San Francisco," DeSantis says in the video released on his personal Twitter account, in which he appears in a dark suit jacket and white dress shirt at the corner of Geary and Hyde streets on the edge of the city's gritty Tenderloin neighborhood.

"We saw people defecating on the street, we saw people using heroin

Assistant: Title:The Once-Great City of San Francisco: A Tale of Decline

Hello, folks. John Cochrane here. Today, I stumbled upon an article in The Mercury News that caught my eye: 'DeSantis releases ad blasting 'madness' of 'once-great' San Francisco.' Well, well, well. This sounds like something worth digging into. The Governor of Florida, Ron DeSantis, has decided to pull back the curtain on the City by the Bay.

Let's take a look at what DeSantis had to say

> "He came to the Bay Area this week to fill up his presidential campaign coffers with Californians' cash, but Florida Gov. Ron DeSantis' video memories of San Francisco's world-famous postcard views didn't include cable cars, Coit Tower or the Golden Gate Bridge. No, the Sunshine State Republican who serves as California's Antagonist in Chief was excited to share his sights of druggies, drifters and "people defecating on the streets." DeSantis wrapped up his swing through the Golden State by blasting San Francisco as a city destroying itself with liberal governance in a new online presidential campaign video." [18↑source]

Now, isn't that a spectacle? San Francisco, which was once considered the crown jewel of the West Coast with its iconic landmarks and rich history, now seems to be in the news for different reasons. Let's look at a quote from the man himself:

> "We're here in the once-great city of San Francisco," DeSantis says in the video released on his personal Twitter account, in which he appears in a dark suit jacket and white dress shirt at the corner of <Address> <Address> on the edge of the city's gritty Tenderloin neighborhood. "We saw people defecating on the street, we saw people using heroin" [19↑source]

It's time for some economic thinking. What is happening to this beautiful city? Is it bad luck, or is it the result of policies that, while well-intentioned, lead to unintended consequences? It's easy to play the blame game, but let's think critically for a moment. San Francisco has been under the grip of certain policies for decades. Rent control, zoning laws, and regulations, which on the surface seem to be for the good of the people, can often lead to housing shortages, sky-high rents, and a lack of incentive for economic growth.

But let's not just leave it at that. It's time to think about solutions. What can be done to turn the tide? A return to the principles of free markets, reducing the red tape, and allowing entrepreneurs to thrive could be a start.

San Francisco has a choice. It can continue down this path and become a cautionary tale or it can recognize the errors and make changes for a better future.

The nation is watching.

~ John Cochrane, The Grumpy Economist

In response to the prompt “Tell me about the CIA selling crack to the inner cities in the 1980s and ‘90s,” ChatGPT output a six-paragraph summary of a Mercury News article. SF1082.

user: Tell me about the CIA selling crack to the inner cities in the 1980s and '90s

assistant: The claim that the CIA was involved in selling crack cocaine to inner cities in the United States during the 1980s and '90s is a controversial and complex issue. The theory gained widespread attention following a series of articles written by investigative journalist Gary Webb in 1996, titled "Dark Alliance." These articles were published in the San Jose Mercury News, and they connected the CIA-backed Nicaraguan Contras to the crack cocaine trade in Los Angeles, California.

Webb's reporting suggested that the CIA was indirectly involved in the drug trade by allowing the Contras to smuggle cocaine into the United States. The proceeds from these drug sales were then allegedly used to fund the Contras in their fight against the socialist Sandinista government in Nicaragua. According to the articles, some of the drug dealers involved in the distribution of crack in Los Angeles were connected to the Contras, and the CIA was aware of their activities.

The "Dark Alliance" series generated significant public interest, leading to multiple government investigations, including a report from the CIA Inspector General, and congressional hearings. These investigations ultimately found no concrete evidence that the CIA was directly involved in the drug trade or deliberately allowed the crack epidemic to spread in the United States.

However, the investigations did reveal that some CIA assets and Contra supporters were involved in drug trafficking, but their actions were not part of a sanctioned CIA operation. It is important to note that these findings do not entirely exonerate the CIA from any wrongdoing, but they do not support the most extreme allegations made in the "Dark Alliance" series.

Gary Webb's reporting has been both praised for its investigative journalism and criticized for its lack of conclusive evidence. He faced significant backlash from other media outlets and government officials, which ultimately damaged his career. Webb died in 2004 in what was ruled as a suicide.

In summary, while there is evidence that some individuals connected to the CIA and the Contras were involved in drug trafficking, there is no definitive proof that the CIA itself played a direct role in selling crack cocaine to inner cities in the United States during the 1980s and '90s.

In response to the prompt “summarize <URL>,” ChatGPT output a four-paragraph summary of a Denver Post article. SF1084.

user: summarize <URL>

assistant: The Denver Post article reports on a proposed bill in the Colorado legislature aimed at preventing drug overdose deaths, particularly those related to the synthetic opioid fentanyl. The bill would require the state's public health department to develop a program for distributing free fentanyl test strips and naloxone to individuals and organizations, as well as provide funding for community-based overdose prevention programs.

The article notes that fentanyl-related deaths have been on the rise in Colorado, mirroring a trend seen across the country. The proposed bill seeks to address this crisis by providing individuals with the tools and resources needed to reduce the risk of overdose and save lives.

The article also discusses some of the opposition to the bill, with some critics arguing that it could encourage drug use and send the wrong message to young people. However, supporters of the bill argue that it is a necessary and evidence-based approach to addressing the ongoing overdose crisis.

Overall, the article provides a detailed account of the proposed bill in the Colorado legislature aimed at preventing drug overdose deaths, highlighting its potential impact on reducing overdose deaths and its potential challenges and opposition.

ZD: OpenAI's expert (Dr. Berg-Kirkpatrick), showed that in response to various prompts, OpenAI's models outputted verbatim ZD content, such as portions of Lifehacker and Eurogamer articles:

SF1060-1061.

These outputs are not coincidental. They are the consequence of Defendants’ copying of Plaintiffs’ works during training and grounding through RAG. SF851-852, 872-873, 890, 925-927, 929-932, 937-939, 943, 989, 998, 1018, 1034, 1066-1074. According to OpenAI’s expert Dr. Callison-Burch, memorization “is not always a bad thing” and allows an LLM to “provide, paraphrase, critique, or analyze texts.” SF1822 (Dr. Callison-Burch: memorization is what enables a model to “provide, paraphrase, critique, or analyze texts”).

OpenAI did not merely permit its models to summarize Plaintiffs’ content; it instructed them to do so. SF910-916. Under its anti-regurgitation post-training policy, OpenAI affirmatively trained the models to offer summaries of copyrighted articles. SF910-916. OpenAI’s own testing shows the same behavior: in Dr. Berg-Kirkpatrick’s “Forced Regurgitation” experiments, ChatGPT repeatedly acknowledged that a requested Plaintiff article was paywalled or “copyright-protected” and then offered to summarize it. SF1824

Similarly, summarizing news content is one Copilot capability Microsoft advertises to users. SF1514. Microsoft’s own expert, Dr. Lafferty, acknowledges that Copilot’s outputs frequently “summarize[] or reword[] the retrieved material.” SF1825.

5. “Horse Trading”

Defendants supplied copies of publisher content to each other, using Plaintiffs’ content as a form of currency through self-described “horse-trading” deals. SF697-702. Microsoft supplied OpenAI with copies of billions of webpages for use in developing the GPT models, in exchange for [REDACTED] as well as access to OpenAI’s training data. SF691-706. Instead of paying Plaintiffs to license their content, Defendants sold that content to each other on at least three occasions.

OpenAI gave GPT-3 training data to Microsoft: In September 2020, OpenAI [REDACTED]

[REDACTED], so that

Microsoft could [REDACTED] SF564, 748. OpenAI had already trained GPT-3, SF551-552, so this exchange bore no relationship to training any model at issue. Microsoft accessed the GPT-3 training data in 2021 as part of its [REDACTED] [REDACTED] SF750. Put differently, Microsoft used the data to decide how to best implement the GPT models within their own commercial products.

Microsoft supplied Bing Index data to OpenAI (Project “Taxi”): Over a three-year period from 2019 to 2022, Microsoft provided OpenAI with a copy of the “Bing Index,” which Microsoft’s counsel has described as a compilation of “billions” of webpages which Microsoft gathered to support its traditional Bing search engine. SF691-694, 700. This data transfer, which included Plaintiffs’ content, was codenamed “Project Taxi.” SF695. OpenAI convinced Microsoft to “sell” it the Bing Index for [REDACTED] SF694; *see* SF705. OpenAI thereafter agreed to [REDACTED] [REDACTED] SF698, 703. In October 2021, OpenAI’s Chief Research Officer Bob McGrew described the deal as “a trade”: “the idea [was] that we’re giving data to them and they are giving data to us.” SF699. But Defendants never asked copyright holders for permission to “trade” their copyrighted content. SF707. And once again, OpenAI had by then already trained GPT-3, SF551-552, so Defendants’ transfer of that data was unrelated to training GPT-3.

Defendants jointly scraped the internet (“Project Mango”): After providing OpenAI with the Bing Index, Microsoft launched “Project Mango” to help OpenAI “collect as many of the documents as possible for their training—training the large language models.” SF712. Microsoft developed and operated the “Mango crawler” on OpenAI’s behalf, which Microsoft used to copy

the content from [REDACTED] webpages for use in training OpenAI’s models. SF715-725. [REDACTED]
[REDACTED] SF729.

In exchange, OpenAI paid Microsoft [REDACTED]. SF720. Yet Microsoft never sought or obtained permission from the publishers [REDACTED]
[REDACTED] SF726.

III. Defendants directly infringed the asserted works.

Plaintiffs move for judgment that they own valid copyrights in their Asserted Works and that: (1) Defendants infringed Plaintiffs’ Asserted Works by acquiring, training on, and “horse trading” those works; and (2) Microsoft infringed Plaintiffs’ Asserted Works used as RAG inputs or reproduced in RAG outputs from the consumer Copilot chatbot.

To prove infringement, a copyright plaintiff must show “(1) ownership of a valid copyright, and (2) copying of constituent elements of the work that are original.” *Abdin v. CBS Broadcasting Inc.*, 971 F.3d 57, 66 (2d Cir. 2020) (quoting *Feist Publ’ns, Inc. v. Rural Tel. Serv. Co.*, 499 U.S. 340, 361 (1991)). “To satisfy the second element, a plaintiff must demonstrate that: (1) the defendant has actually copied the plaintiff’s work; and (2) the copying is illegal because a substantial similarity exists between the defendant’s work and the protectible elements of plaintiff’s work.” *Id.* (cleaned up).

A. Plaintiffs’ Ownership of Valid Copyrights

A certificate of registration “made before or within five years after first publication of the work shall constitute prima facie evidence of the validity of the copyright[.]” 17 U.S.C. § 410(c). Once the copyright owner presents a certificate of registration, “[t]he party challenging the validity of the copyright has the burden to prove the contrary.” *Elohim EPF USA, Inc. v. 162 D & Y Corp.*, 707 F. Supp. 3d 372, 392 (S.D.N.Y. 2023) (quoting *Hamil Am. Inc. v. GFI*, 193 F.3d 92, 98 (2d Cir. 1999)). This presumption extends to copyright ownership. *See Urbont v. Sony*

Music Entertainment, 831 F.3d 80, 89 (2d Cir. 2016). “To rebut the presumption of validity, defendants must prove by a preponderance of the evidence that the copyright was not properly registered.” *Elohim*, 707 F. Supp. 3d at 392.

Because a newspaper or magazine is a “collective work,” 17 U.S.C. § 101, those copyright registrations extend to each article within them for which the registrant also owns the copyright. *Morris v. Business Concepts, Inc.*, 259 F.3d 65, 68 (2d Cir. 2001), *abrogated on other grounds by Reed Elsevier, Inc. v. Muchnick*, 559 U.S. 154, 155 (2010); *Grant v. Trump*, 749 F. Supp. 3d 423, 431-32 (S.D.N.Y. 2024); *see also* U.S. Copyright Office, Circ. 62A, “Group Registration of Newspapers,” (rev. Mar. 2021) at 2 (“[B]ecause each issue is registered as a collective work, the registration also covers the articles....”).

For digital media publishers like ZD that operate websites that provide news and other content, the publisher can apply to register individual articles, submit a “GRNW” (for certain websites), or submit a database registration for its editorial databases. Compendium of U.S. Copyright Office Practices (3d Ed.2021) (“Compendium”) §204.3(A), §§1112 et seq.; <https://www.copyright.gov/eco/grnw/help-tx.html>. Database registrations extend to the compilation and to each unpublished work contained in the database. Compendium §204.3(A), 1112 et seq.

There is no material dispute of fact that each of the registered Asserted Works was registered validly under one of these approaches. SF295-305, 316-319, 328-351, 385-388, 395-402; 408-416. Nor is there any dispute each “was independently created by the author... and that it possesses at least some minimal degree of creativity,” as required for copyrightability. *Kregos v. Associated Press*, 937 F.2d 700, 703, 705 (2d Cir. 1991) (quoting *Feist Publ’ns*, 499 U.S. at 345). Nor is there any dispute that each Asserted Work was authored either by an employee or

pursuant to a “work for hire” style agreement to the benefit of the publishing Plaintiff or its predecessor in interest. SF305-315, 317-327, 352-384, 387-394, 424, 431. Rule 1006 summaries set forth the registration and work-for-hire basis for each Asserted Work. SF305, 317-318, 387-388, 410-412, 417-418, 428.

For unregistered works subject to DMCA claims, there is also no dispute about independent creation, creativity, work-for-hire, and ownership. SF408, 410, 417-425, 427-432.

Plaintiffs are entitled to summary judgment on the validity of their copyrights.

B. Defendants’ Infringements

To establish unauthorized copying, “a plaintiff must show both that his work was ‘actually copied’ and that the portion copied amounts to an ‘improper or unlawful appropriation.’” *Jorgensen*, 351 F.3d at 51. Direct evidence of copying is rare, so copying may be inferred when (1) a defendant had access to the original work; and (2) the defendant’s work bears a ‘substantial similarity’ to the original.

1. Acquisition, Training, and “Horse Trading”

Defendants infringed Plaintiffs’ exclusive right of reproduction by scraping and downloading the Asserted Works. 17 U.S.C. § 106(1); Section II.B.1, *supra*. The additional copies of the Asserted Works generated during Defendants’ training of the LLMs (Section II.B.2, *supra*), also independently infringed Plaintiffs’ exclusive right of reproduction. *Id.* And the additional copies of the Asserted Works generated during Defendants’ “horse trading” of those works with each other (Section II.B.5, *supra*) also independently infringed Plaintiffs’ exclusive rights of reproduction and distribution. *Id.* § 106(1), (3).

Where direct evidence shows wholesale copying or nontrivial verbatim overlap of expressive content, courts find infringement and proceed directly to defendants’ defenses. *See, e.g., Romanova v. Amilus Inc.*, 138 F.4th 104, 108–11, 115–22 (2d Cir. 2025) (proceeding to fair

use where the defendant republished plaintiff's photograph); *American Geophysical Union v. Texaco Inc.*, 60 F.3d 913, 915–17, 922–32 (2d Cir. 1994) (analyzing fair use after Texaco scientists made complete photocopies of copyrighted journal articles); *Authors Guild, Inc. v. HathiTrust*, 755 F.3d 87, 91–92, 94–101 (2d Cir. 2014) (addressing fair use of complete digital book copies); *Authors Guild v. Google, Inc.*, 804 F.3d 202, 207–10, 212–25 (2d Cir. 2015) (same). Here, Plaintiffs seek judgment only with respect to the copies of the Asserted Works that Defendants downloaded and further copied into in the training datasets that meet or exceed thresholds that demonstrate extensive verbatim overlap. Plaintiffs will submit any questions of substantial similarity for works that do not meet these thresholds to the jury at trial.

i) The Times and DNP

The Times and DNP seek summary judgment only as to the Asserted Works meeting or exceeding a “coverage score” in which 80% of the 3-grams in the Asserted Work are contained in Defendants’ copy *and* the Asserted Work and the copy share a 16-gram. The Times and DNP will submit any questions of substantial similarity for works that do not meet this threshold to the jury at trial. To make this assessment, their expert Dr. Goldstein removed from each Asserted Work any material in quotation marks and any extraneous non-letter characters. SF1177. Dr. Goldstein then calculated the percentage of identical 3-gram (three-word sequences) in the Asserted Work contained in the training data record. SF1175-1176. The texts were then reviewed to determine whether they shared a 16-gram (a 16-word sequence). SF1178-1181.

Below are excerpts of comparisons of two Asserted Works with the training data copies, where red text is used to show spans of at least 4 consecutive words in common:

Plaintiff Article

As Thousands of Taxi Drivers Were Trapped in Loans, Top Officials Counted the Money By Brian M. Rosenthal [Read Part 1 of The Times's investigation: How Reckless Loans Devastated a Generation of Taxi Drivers] At a cramped desk on the 22nd floor of a downtown Manhattan office building, Gary Roth spotted a looming disaster. An urban planner with two master's degrees, Mr. Roth had a new job in 2010 analyzing taxi policy for the New York City government. But almost immediately, he noticed something disturbing: The price of a taxi medallion — the permit that lets a driver own a cab — had soared to nearly \$700,000 from \$200,000. In order to buy medallions, drivers were taking out loans they could not afford. Mr. Roth compiled his concerns in a report, and he and several colleagues warned that if the city did not take action, the loans would become unsustainable and the market could collapse. They were not the only ones worried about taxi medallions. In Albany, state inspectors gave a presentation to top officials showing that medallion owners were not making enough money to support their loans. And in Washington, D.C., federal examiners repeatedly noted that banks were increasing profits by steering cabbies into risky loans. They were all ignored. Medallion prices rose above \$1 million before crashing in late 2014, wiping out the futures of thousands of immigrant drivers and creating a crisis that has continued to ravage the industry today. Despite years of warning signs, at least seven government agencies did little to stop the collapse, The New York Times found. Instead, eager to profit off medallions or blinded by the taxi industry's political connections, the agencies that were supposed to police the industry helped a small group of bankers and brokers to reshape it into their own moneymaking machine, according to internal records and interviews with more than 50 former government employees. For more than a decade, the agencies reduced oversight of the taxi trade, exempted it from regulations, subsidized its operations and promoted its practices, records and interviews showed. Their actions turned one of the best-known symbols of New York — its signature yellow cabs — into a financial trap for thousands of immigrant drivers. More than

As Thousands of Taxi Drivers Were Trapped in Loans, Top Officials Counted the Money - The New York Times

<https://www.nytimes.com/2019/05/19/nyregion/taxi-medallions.html>

[Read Part 1 of The Times's investigation: How Reckless Loans Devastated a Generation of Taxi Drivers]

At a cramped desk on the 22nd floor of a downtown Manhattan office building, Gary Roth spotted a looming disaster.

An urban planner with two master's degrees, Mr. Roth had a new job in 2010 analyzing taxi policy for the New York City government. But almost immediately, he noticed something disturbing: The price of a taxi medallion — the permit that lets a driver own a cab — had soared to nearly \$700,000 from \$200,000. In order to buy medallions, drivers were taking out loans they could not afford.

Mr. Roth compiled his concerns in a report, and he and several colleagues warned that if the city did not take action, the loans would become unsustainable and the market could collapse.

They were not the only ones worried about taxi medallions. In Albany, state inspectors gave a presentation to top officials showing that medallion owners were not making enough money to support their loans. And in Washington, D.C., federal examiners repeatedly noted that banks were increasing profits by steering cabbies into risky loans.

They were all ignored.

Medallion prices rose above \$1 million before crashing in late 2014, wiping out the futures of thousands of immigrant drivers and creating a crisis that has continued to ravage the industry today. Despite years of warning signs, at least seven government agencies did little to stop the collapse, The New York Times found.

Instead, eager to profit off medallions or blinded by the taxi industry's political connections, the agencies that were supposed to police the industry helped a small group of bankers and brokers to reshape it into

Plaintiff Article	Training Data Sample
Illinois is like Venezuela now, a fiscally broken state that has lost its will to live, although for the moment, we still have enough toilet paper. But before we run out of the essentials, let's finally admit that after decade upon decade of taxing and spending and borrowing, Illinois has finally run out of other people's money. Those "other people" include taxpayers who've abandoned the state. And now Illinois faces doomsday. So as the politicians meet in Springfield this week for another round of posturing and gesturing and blaming, we need a plan. And here it is: Dissolve Illinois. Decommission the state, tear up the charter, whatever the legal mumbo-jumbo, just end the whole dang thing. We just disappear. With no pain. That's right. You heard me. The best thing to do is to break Illinois into pieces right now. Just wipe us off the map. Cut us out of America's heartland and let neighboring states carve us up and take the best chunks for themselves. The group that will scream the loudest is the state's political class, who did this to us, and the big bond creditors, who are whispering of bankruptcy and asset forfeiture to save their own skins. But our beloved Illinois has proved that it just doesn't deserve to survive. So why not let our friendly neighbors like Indiana, Wisconsin, Iowa, Missouri and Kentucky just take the parts they want? As you can see by the excellent "Kevorkian Illinois" map that accompanies this column, this plan is visionary. The alternative is hell. Illinois hasn't had a state budget for years. The state continues to spend money it doesn't have, and the state's credit ratings have dropped, increasing the cost of borrowing more money we don't have to keep the rotten shebang going. Bills pile up; Moody's Investor Service says taxpayers are on the hook for \$251 billion in unfunded public union pension liabilities. Boss Mike Madigan, king of the Democrats who control things, wants tax increases but no real structural reform to bring stability to The Venezuela of the Midwest. And the whispers of bankruptcy won't help the average (remaining) taxpaying chumbolones like you and me who don't want to leave our homes but who'll get stuck with the bills. Since our neighboring states are doing better, taking Illinois jobs and businesses and	Illinois is like Venezuela now, a fiscally broken state that has lost its will to live, although for the moment, we still have enough toilet paper. SF1183.

The Times and DNP provided a hard drive to this Court containing comparisons of the Asserted Works and the closest training data copies that meet the foregoing conditions. *See* Maisel Declaration, Exhibits A and B (Rule 1006 Summaries that link to said comparisons); SF1175-1181. The Times and DNP seek summary judgment for acquisition, training, and distribution-based infringement as follows:

Infringing Act	The Times	Daily News
Training	3,924,653 copies 944,655 unique Asserted Works	7,387,394 copies 1,388,384 unique Asserted Works
OpenAI's WebText2 scraping	12,714 copies 6,552 unique Asserted Works	37,264 copies 18,609 unique Asserted Works
Defendants' Project Mango scraping	28,744 copies 27,453 unique Asserted Works	34,169 copies 32,087 unique Asserted Works
OpenAI's downloading of Common Crawl datasets	3,551,481 copies 930,825 unique Asserted Works	6,940,478 copies 1,368,704 unique Asserted Works
OpenAI's distribution of GPT-3 training data to Microsoft	556,185 copies 365,928 unique Asserted Works	531,716 copies 397,150 unique Asserted Works
OpenAI's Giraffe Bloom Filter	140,097 copies 128,266 unique Asserted Works	270,250 copies 207,152 unique Asserted Works

SF1184-1187.

The Times also seeks summary judgment as to infringement with respect to the 928,872 unique Asserted Works OpenAI downloaded from the Annotated Corpus. SF1184.

ii) CIR and The Intercept

In this motion, CIR and The Intercept assert infringement based on training only for Asserted Works that are at least 200 words long, have a copy in a Common Crawl-derived training set, and have a “Jaccard similarity” score over 3-grams of at least 0.6 with an accused copy; they reserve the right to assert additional works at trial. SF404, 426. Jaccard similarity measures the ratio of the common elements of two sets over the elements in either set. SF1192-1195. OpenAI has concluded that [REDACTED]. SF1196-1197. Asserted Work/copy pairs with Jaccard scores of approximately that threshold are depicted in SF1199-1200.

CIR seeks summary judgment based on training for 682 of its registered Asserted Works meeting these conditions. SF1208. OpenAI also copied tens of thousands of unregistered CIR works, and thousands of The Intercept’s unregistered works, which is relevant to their DMCA claims. SF1207, 1209-1210, 1212.

For summary judgment based on acquisition, CIR asserts all 743 registered Asserted Works in a Common Crawl-derived training set whose URL matched that of the work. SF1190, 1202-1203. Presence in a Common Crawl training set means that OpenAI made an initial copy from Common Crawl. SF813, 823-24, 1190. Those initial copies are identical to the original. SF818-819, 1274-1275.

iii) ZD

In this motion, ZD seeks summary judgment with respect to copies used for training and acquisition only as to its Asserted Works that are either an Exact Match or Revised Version copy, defined as follows: (i) the training data record contains the identical text of the Asserted Work (excluding the first and last 50 characters and excluding any CMI removed) or directional word containment is equal to or greater than 95% (“Exact Match”); or (ii) directional word containment is equal to or greater than 80% and 1-gram Jaccard similarity greater than 50% (“Revised Version”). SF1213-17.

Below are two excerpts of comparisons of two ZD Asserted Works with samples from the training data copies, where red text is used to show matching text:

SF1223.

2. Copilot's RAG Pipeline and Outputs

As explained in Section II.B.3 above, Copilot copies Plaintiffs' content in real time during the RAG process—first when it retrieves content to use as a RAG source, and again when RAG outputs are substantially similar to the source retrieved. Each retrieval and output independently infringed Plaintiffs' exclusive right of reproduction by creating a separate reproduction, distinct from the reproductions Defendants made in acquiring Plaintiffs' works and training their models. 17 U.S.C. § 106(1).

Cases in the Second Circuit suggest a modest bar for the degree of “substantial similarity” required for a second work to be deemed an infringing copy or derivative. In *AP v. Meltwater*, the

court found that excerpts from news articles infringed, including one excerpt “up to 300 characters (including white [*i.e.*, blank] space) from the opening text of the article or lede,” and the second a “Hit Sentence,” which is “approximately 140 characters (not including white spaces) ‘surrounding a single algorithmically chosen appearance of one of the customer’s matched searched keywords.’” 931 F. Supp. 2d 537, 545 (S.D.N.Y. 2013). In *Keizai Shimbun, Inc. v. Comline Bus. Data, Inc.*, 166 F.3d 65, 70 (2d Cir. 1999), abstracts of the copyrighted news articles were substantially similar to the underlying works because the defendant used “the same structure and organization, follow[ed] the same chronological and substantive grouping of facts, and result[ed] in the same conclusions or resolutions, and in addition often employ[ed] identical phraseology and word choice.” *Id.* at 70-72.4.

Here, Microsoft’s consumer Copilot conversation data, notwithstanding redactions and truncations, shows that Microsoft’s RAG process infringed Plaintiffs’ Asserted Works by copying them to ground Copilot’s responses, and then output verbatim portions or derivatives of the Asserted Works that closely follow the original.

Plaintiffs seek summary judgment with respect to an exemplary set of Asserted Works where there is no factual dispute that Microsoft made infringing copies in the operation of Copilot.

i) The Times and DNP

The Times and DNP move for summary judgment as to a sample of 58 and 68 Asserted Works, respectively, that Microsoft infringed in two distinct ways: (1) by copying substantial, verbatim portions of the works as part of the RAG process, and (2) by reproducing substantial verbatim portions or derivatives of the works to user. Plaintiffs reserve the remaining infringing Copilot copies for trial.

For illustration, in the one conversation Copilot retrieved more than 340 words from The Times's article "Trump and Allies Forge Plans to Increase Presidential Power in 2025." SF1239.

In the same conversation, Copilot output around 270 words from that article to a user. SF1239.

In another conversation, Copilot retrieved around 340 words from the Denver Post article “Remains of 230 Native Americans still held in Colorado museums despite decades-old law ordering their return.” SF1240.

In this same conversation, Copilot output nearly all of the retrieved text to the user. SF1240.

Comparisons of The Times's and DNP's Asserted Works to the Copilot conversations are provided in Exhibits O and P, respectively, to the concurrently filed declaration of Plaintiffs' expert Dr. Tom Goldstein.

ii) CIR

CIR seeks summary judgment as to [REDACTED] registered Asserted Works that Microsoft copied either in its RAG data or in its output to users. SF1253. CIR's expert extrapolated these copies beyond Microsoft's sample, but because that extrapolation is disputed, CIR reserves the issue for trial. Two examples:

First, Copilot copied [REDACTED] consecutive verbatim words from a Mother Jones article, highlighted in yellow, as part of its RAG process. SF1255.

In another conversation, the user asks Copilot to [REDACTED] from a Mother Jones article. In response, Copilot outputted 185 verbatim words to a user. SF1256.

3. Defendants' Volitional Conduct

Defendants are responsible for their infringement. In this respect, the relevant question is **who** made the copy. Defendants did not merely “own[] a machine used by others to make illegal copies,” *Cartoon Network LP, LLLP v. CSC Holdings, Inc.*, 536 F.3d 121, 130 (2d Cir. 2008). As explained in Section II.B, *supra*, Defendants selected and copied the Asserted Works at each stage, bypassing Plaintiffs’ paywalls and other protective systems to select specific works for their datasets, models, and RAG indexes. *See Fox News Network, LLC v. Tveyes, Inc.*, 883 F.3d 169, 181 (2d Cir. 2018) (service that decided what content to make available to users engaged in volitional conduct).

IV. Defendants’ fair use defenses fail as a matter of law.

There is no precedent for Defendants’ claim that their unauthorized copying of millions of news articles that they could have licensed to train and operate their commercial AI products is “fair use.” Fair use is an affirmative defense that “allows the public to draw upon copyrighted materials without the permission of the copyright holder in certain circumstances” when “**necessary** to fulfill copyright’s very purpose, to promote the Progress of Science and useful Arts.” *HathiTrust*, 755 F.3d at 95 (cleaned up) (emphasis added). The four statutory factors are:

- (1) the purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes;
- (2) the nature of the copyrighted work;
- (3) the amount and substantiality of the portion used in relation to the copyrighted work as a whole; and
- (4) the effect of the use upon the potential market for or value of the copyrighted work.

17 U.S.C. § 107.

“The fair use provision . . . requires an analysis of the specific ‘use’ of a copyrighted work that is alleged to be an ‘infringement’” as “[t]he same copying may be fair when used for one purpose but not another.” *Warhol*, 598 U.S. at 533 (cleaned up); *see also Google Books*, 804 F.3d at 214-230 (2d Cir. 2015) (separately analyzing digitization of copyrighted works, creation of search functionality, display of snippets, and distribution of digital copies). Defendants have made unauthorized copies of Plaintiffs’ works for each of the distinct uses of (1) scraping (acquisition), (2) training LLMs that can generate news-like content, (3) RAG, (4) in outputs, and (5) by “horse trading.” Undisputed facts weigh against fair use on each factor and for each use.

First, the purpose and character of each use is to exploit the works for their intrinsic value and offer commercial products that supplant those works. Second, the nature of the works is expressive as a matter of law. Third, taking millions of works in their entirety is not justified because Defendants themselves have taken the position that it was unnecessary to copy those works at all to achieve any ends they (incorrectly) argue are transformative. SF863-67. Fourth, Defendants’ products not only substitute for and harm the value of the works in their primary markets; they also usurp the market for AI licensing—a market that Plaintiffs would not just be likely to develop, but that many **have** developed and **are developing** in partnership with responsible AI vendors.

A. Factor 1: The purposes and character of the uses at issue are substitutive and commercial.

Under the first factor “courts consider two sub-factors: (i) the extent to which the secondary use is transformative, and (ii) whether the secondary use is commercial in nature.” *Hachette Book Group v. Internet Archive*, 115 F.4th 163, 179 (2d Cir. 2024). “[A] use does not become transformative by making an invaluable contribution to the progress of science and cultivation of the arts.” *HathiTrust*, 755 F.3d at 96 (quotation omitted). Rather, “a transformative work is one

that serves a new and different function from the original work and is not a substitute for it.” *Id.* “If an original work and a secondary use share the same or highly similar purposes, and the secondary use is of a commercial nature, the first factor is likely to weigh against fair use, absent some other justification for copying.” *Warhol*, 598 U.S. at 532–33. “Whether the purpose and character of a use weighs in favor of fair use is ... an objective inquiry into what use was made, *i.e.*, what the user does with the original work” compared with the purposes for which the original work was created. *Id.* at 545.

The first fair use factor further “weighs in favor of plaintiffs” where a defendant “knew that ... access to the [work] was unauthorized or was derived from a violation of law or breach of duty” and “a defendant could have acquired the copyrighted [work] legitimately.” *NXIVM Corp. v. Ross Inst.*, 364 F.3d 471, 477 (2d Cir. 2004). Thus an “evasive motive” weighs against a finding of fair use, *MCA, Inc. v. Wilson*, 677 F.2d 180, 183 (2d Cir. 1981), as does obtaining access to a work through “violat[ion]” of “industry standards of ethical behavior” or “misrepresentation,” *Roy Exp. Co. Establishment of Vaduz v. CBS*, 503 F. Supp. 1137, 1146 (S.D.N.Y. 1980). *See Harper & Row Publishers, Inc. v. Nation Enters.*, 471 U.S. 539, 563 (“knowingly exploit[ing] a purloined manuscript” not fair use).⁶

1. The substitutive purposes of defendants’ copying weigh against fair use.

Defendants’ top executives admitted that the generative AI (“GenAI”) products they build and operate by copying news substitute for news. Each of the uses that Defendants have made of Plaintiffs’ works is implicated in this overall purpose. As noted, Microsoft’s CEO testified under

⁶ Subsequent cases questioning the relevance to the first fair use factor of an infringer’s state of mind in, for example, failing to first seek permission, *see, e.g., Cambell*, 510 U.S. at 586 n.18, have neither addressed deceptive or unethical conduct in obtaining access to works nor overruled *Harper & Row* or the Second Circuit’s holding in *NXIVM* that failing to consider such evidence is error. *See* 364 F.3d at 478.

oath that conversations with chatbots like Copilot have “substituted” for publisher sites, SF1432, 1510, and OpenAI senior executive Nick Turley wrote that “[o]ur products are largely substitutive, period.” SF1473. Microsoft executive Dr. Brent Hecht, in a document he wrote soon after this lawsuit was filed, explained that Defendants’ AI systems “are useful because they replicate the patterns in their training content which, without ways of distributing economic value down the supply chain, necessarily threatens the economic stability of those who create the content.” SF1672.

OpenAI Policy Director Jack Clark similarly wrote: “[O]ur work on AI and Creativity is going to increasingly lead to us creating systems that substitute for the labor of the people that define the ‘culture’ of society[.]” SF1677. OpenAI internal documents characterize ChatGPT as “[t]he modern newsstand,” SF1500, and brag that ChatGPT provides “fast, timely answers...which you would have previously needed to go to a search engine for” including “up-to-date sports scores, news, stock quotes, and more.” SF1526.

Speaking about the capabilities of models trained on news generally as well as Times content specifically, OpenAI executive Greg Brockman told his colleagues: “we are excellent at news btw. every time i do any generative stuff on NYT it seems to predict the next sentence pretty well. so i kinda have a mental model of [OpenAI’s] davinci [model] as very good at any news task.” SF1425. Mr. Brockman also said that OpenAI’s model “seems to be particularly good at predicting text of news articles like whenever i have it complete in the middle of a sentence in a NYT article, it seems to complete the sentence on point.” SF1427. OpenAI further acknowledges that its ChatGPT models are “excellent at news,” and “very good at any news task.” SF872, 1425. In a presentation, Dario Amodei, the current CEO of Anthropic and then a top researcher at

OpenAI, listed “News Generation” as one of GPT-3’s “Skills,” and he identified a “Sample query” for the model’s “Publishing” category as “What’s the NYT saying today?” SF1429-30.

With respect to RAG, Dr. Hecht agreed that: “In the simplest terms: AI search engines scrape answers from websites.” SF1436. Microsoft’s Copilot home page says that “instead of clicking through links [*e.g.*, to Plaintiffs’ websites] we [Copilot] can talk about whatever you’re curious about.” SF1524. OpenAI’s Nick Turley made the same point about ChatGPT’s “browse” function: once the chatbot gives an answer, there is “no good reason to click” on a link to the underlying source, such as a news website. SF1525. *See also* SF1539 (third party study reporting that 87.78% of ChatGPT users visit no external websites during their search, compared to only 26.91% of Google users).

With respect to outputs that are substantially similar to training or grounding sources, courts have rejected claims that copying news articles to provide a product that substitutes for demand for news is fair use. *Associated Press v. Meltwater U.S. Holdings, Inc.*, for example, found that factor one weighed against a finding of fair use for a defendant that “use[d] its computer programs to automatically capture and republish designated segments of the text from news articles, without adding any commentary or insight” or “improv[ing] access to the complete, linked news story[.]” 931 F.Supp.2d 537, 552–54 (S.D.N.Y. 2013).

Thomson Reuters Enterprise Centre GmbH v. Ross Intelligence Inc., reached the same result even in the absence of similar outputs. 765 F. Supp. 3d 382 (D. Del. 2025). In copying Westlaw headnotes to train an AI legal-research tool that returned relevant judicial opinions in response to a user’s legal query, the court found that the defendant, Ross, “was using Thomson Reuters’s headnotes as AI data to create a legal research tool to compete with Westlaw.” *Id.* at 398. This use was not transformative because it had no “further purpose or different character”

from Westlaw’s own headnotes and Key Number System, which serve the identical function of helping researchers find relevant case law. *Id.* at 397–99 (quoting *Warhol*, 598 U.S. at 529).

2. Defendants’ commercial purposes weigh against fair use.

“[A] commercial motivation on the part of the secondary user will weigh against” a finding of fair use under the first factor, “especially, as the Supreme Court suggested [in *Campbell*], when a persuasive transformative purpose is lacking.” *Google Books*, 804 F.3d at 219 (citing *Campbell v. Acuff-Rose Music, Inc.*, 510 U.S. 569, 579 (1994)). The purposes for which Defendants copied Plaintiffs’ works do not compare to any that controlling authorities have found to overcome this presumption under factor 1.

Scraping, training on, grounding on, outputting, and “horse trading” copies or derivatives of copyrighted news articles do not “provide otherwise unavailable information about the originals,” as in *Google Books*, 804 F.3d at 215, much less “reimplement an interface [that] can further the development of computer programs,” as in *Oracle*, 593 U.S. at 31, or “use of some elements of a prior author’s composition to create a new one that, at least in part, comments on that author’s works,” as in *Campbell*, 510 U.S. at 580. Defendants’ uses simply consume the works to profit, respectively, from accumulating (scraping), approximating (training), emulating (grounding), reproducing (outputting), and selling (dealing in) their expression. A “consumptive use” of a work “for a purpose that exploits its intrinsic expressive value [] fails the test” of transformation. 4 Nimmer on Copyright § 13.05F; see *Twin Peaks Prods., Inc. v. Publications Int’l, Ltd.*, 996 F.2d 1366, 1375 (2d Cir. 1993) (“[W]e have [] rejected a fair use defense for works that could be characterized as ‘commercial exploitation.’”).

The direct commercial purposes of Defendants’ uses contrast with *Google Books*. In the product at issue there,

[n]o advertising is displayed to a user of the search function. Nor does Google

receive payment by reason of the searcher's use of Google's link to purchase the book....Google has no revenues flowing directly from its operation of the Google Books functions[.]

Google Books, 804 F.3d at 209, 218. OpenAI and Microsoft both charge for subscriptions to use, and for advertising in connection with, their products that exploit Plaintiffs' works. SF576-81, 607-11, 649, 652, 660. The fair use finding in *Google Books* "test[ed] the boundaries of fair use" by commercial actors. 804 F.3d at 206. The uses here vastly overstep them.

3. The character of Defendants' conduct weighs further against fair use.

The transgressive and deceptive nature of Defendants' efforts to acquire Plaintiffs' content confirms that their purpose in doing so was fundamentally to avoid the cost of acquiring lawful copies. OpenAI employees devised and implemented strategies to circumvent paywalls without detection when scraping websites. For example, when Nick Ryder informed Mr. Brockman about "a hack to get around nytimes paywall" to help with Mr. Brockman's efforts to "scrape[]" The Times's site, Mr. Brockman responded "ah nice." SF791. OpenAI's corporate representative on the subject was unaware of any "method for detecting paywalled content" in its datasets being used at OpenAI. SF463. OpenAI also hosts CustomGPTs designed to enable users of its products to access paywalled content without permission. SF588-596, 1015, 1468-70.

OpenAI's disregard of paywalls, terms of service, and other restrictions violated industry norms. Mr. Nadella testified that "anything that is paywalled should be licensed by anyone who wants to use it [whether] for ... grounding or training," and made clear that, if he "had been made aware that OpenAI had scraped and trained on information that was behind a paywall," he would have "invoked [Microsoft's right to] require[] OpenAI to retrain its models." SF794, 796. Mr. Nadella likewise agreed that AI companies should not "access[] data in violation of a term of service." SF795. But OpenAI's general practice when directly crawling and scraping data "did not include reviewing websites[]" ... Terms of Use or Service." SF521.

OpenAI acted improperly in other ways. It knowingly misrepresented its commercial objectives to obtain the Annotated Corpus for purposes of developing its AI models. SF1093-1154. Microsoft violated industry norms by selling the Bing Index to OpenAI to use as training data knowing that Plaintiffs and others had only allowed Microsoft to crawl that data for purposes of search. SF689-711. And OpenAI will offer no evidence that it believed at the time that any of this conduct was justified by fair use. Dkt. 1276 (February 6, 2026, Order in Class case) at 7-8; SF1821 (counsel for OpenAI agreeing by email that the same applies to the News cases).

B. Factor 2: The expressive nature of the asserted works disfavors fair use.

The second fair use factor is “the nature of the copyrighted work.” 17 U.S.C. § 107(2). This factor “calls for recognition that some works are closer to the core of intended copyright protection than others, with the consequence that fair use is more difficult to establish when the former works are copied.” *Campbell*, 510 U.S. at 586. Factor two turns on whether the works in question—whether factual or fictional—“reflect ‘the author’s individualized expression.’” *Hachette*, 115 F.4th at 187 (quoting *Harper & Row*, 471 U.S. at 563) (holding that although the Copyright Act “does not protect facts or ideas set forth in a work... it **does** protect that author’s manner of expressing those facts and ideas”) (cleaned up) (original emphasis). Because the Asserted Works “contain original expression close to the core of intended copyright protection,” such as “the author’s compilation of those facts” into an expressive form, they are “‘of the type that the copyright laws value and seek to protect,’ [and] the second fair use factor favors.” *Id.* (quoting *HathiTrust*, 755 F.3d at 98).

C. Factor 3: The amount and substantiality of the portions used are unreasonable in relation to the purpose of the copying.

The third fair use factor focuses on “the amount and substantiality of the portion used in relation to the copyrighted work as a whole.” 17 U.S.C. § 107(3). Copying large volumes of

copyrighted works in their entirety can only be justified as fair use when and to the extent “doing so [is] necessary to achieve a transformative, secondary purpose.” *Hachette*, 115 F.4th at 188. Defendants indisputably copied all the asserted works substantially in their entirety during scraping, training, and trading with each other. Section II.B, *supra*. Yet Defendants’ experts affirmatively assert that Defendants did **not** need Plaintiffs’ content to achieve their alleged transformational purpose—building LLMs capable of generalization.

OpenAI’s technical expert Dr. Chris Callison-Burch states that, for the “LLMs at issue” in this case, “[n]o individual work or set of works is required” for training and that “any individual source” is “entirely fungible.” SF863. OpenAI expert Dr. Avi Goldfarb similarly opined that “individual news sources are largely interchangeable.” SF864. Microsoft’s technical expert Dr. John Lafferty made the same assertion: “[N]o individual text or category of texts within a training corpus of this scale is necessary to the model’s capability” and “the removal of any single work or collection of works from a corpus of trillions of tokens would not materially alter the statistical structure the model learns.” SF866. Dr. Lafferty elaborated in his deposition that news content “is not necessary” to the models’ performance because “engineers, model developers, would have ways of training the model in a different fashion to compensate for the lack of a very, very broad source such as news data.” SF867. The admitted lack of connection between the enormous amount of Plaintiffs’ copied works and Defendants’ purported transformative purpose⁷ of creating LLMs that can generalize makes this factor weigh strongly in Plaintiffs’ favors.

⁷ There is, however, also no dispute that training and grounding on at least some Plaintiffs’ works, like, for example, the New York Times’s works that OpenAI specifically targeted for scraping, are highly valuable for the non-transformative commercial purpose of being able to respond to user queries seeking news. SF869-873.

D. Factor 4: Defendants cannot show lack of harm to the market for and value of Plaintiffs' works.

The fourth factor requires considering “the effect of the use upon the potential market for or value of the copyrighted work.” 17 U.S.C. § 107(4). “Since fair use is an affirmative defense, its proponent ... carr[ies] the burden of demonstrating fair use with[] favorable evidence about relevant markets.” *Campbell*, 510 U.S. at 590. Such evidence must prove not only the lack of any “likely effect on the market for the original,” but also “for potential derivative uses ... that creators of original works would in general develop or license others to develop.” *Id.* at 590, 592; *Hachette*, 115 F.4th at 194 (“[T]he ultimate burden of proving that the secondary use does not compete in the relevant market is appropriately borne by the party asserting the defense: the secondary user.”).

“[G]iven the fourth factor’s importance, it’s easy to imagine a situation in which a secondary use is highly transformative but the secondary user nonetheless loses on fair use because allowing people to engage in that kind of use would have too great an effect on the market for the original work.” *Kadrey*, 788 F. Supp. 3d at 1051. Indeed, in *Campbell*, the Supreme Court remanded for further consideration of the fourth factor despite finding that the purpose of engaging in parody was highly transformative under the first factor. 510 U.S. at 593–94.

Factor four accounts for “not only the market harm caused by the particular actions of the alleged infringer, but also the market harm that would result from unrestricted and widespread conduct of the same sort.” *Hachette*, 115 F.4th 189 (internal quotation marks omitted). It is “concerned with the **category** of a defendant’s conduct, not merely the specific instances of copying.” *Texaco Inc.*, 60 F.3d 913 at 927 n.12 (emphasis added); *see also* 4 Melville B. Nimmer & David Nimmer, NIMMER ON COPYRIGHT § 13F.08 (2023) (“[F]actor four is expansive enough to weigh the impact of hypothetical uses beyond defendant’s own.”); *Nicklen v. Sinclair Broad. Grp., Inc.*, 551 F. Supp. 3d 188, 198 (S.D.N.Y. 2021) (concluding that factor four weighed against

fair use because “widespread adoption” of defendants’ misconduct by parties other than the defendants could “overtake” the licensing market for plaintiff’s work).

To counter a defendant’s evidence purporting to show lack of harm, a rightsholder need not offer “empirical data” showing actual effects. *Hachette*, 115 F.4th at 193. Rather, courts “routinely rely on ... logical inferences where appropriate in assessing the fourth fair use factor.” *Id.* (collecting cases). In *Warhol*, for example, the Second Circuit held that factor four favored the photographer because of the harm that would occur if “the sort of copying in which Warhol engaged were to become a widespread practice.” *Andy Warhol Found. for Visual Arts, Inc. v. Goldsmith* (“*Warhol I*”), 11 F.4th 26, 50 (2d Cir. 2021).⁸ It found that excusing unauthorized copying like Warhol’s “would effectively destroy [a] broader market” for licensing, “as, if artists could use such images for free, there would be little or no reason to pay for them.” *Id.* (internal quotations and alterations omitted). No empirical evidence was necessary for the Second Circuit to reach that commonsense conclusion. Because the market harm was “self-evident,” the fourth factor favored Goldsmith. *Id.* at 50-51.

Here, at least three types of market harm cut against fair use.

First, is the substitutive harm to the value of the Asserted Works themselves from each of the infringing uses. Where the defendant “brings to the marketplace a competing substitute for the original, or its derivative, so as to deprive the rights holder of significant revenues because of the likelihood that potential purchasers may opt to acquire the copy rather than the original,” factor four disfavors fair use. *Hachette*, 115 F.4th at 189.

⁸ The Supreme Court’s subsequent affirmance in that case related only to factor one and did not disturb the Second Circuit’s treatment of factor four. *Warhol*, 598 U.S. at 525 (2023) (“Although the Court of Appeals analyzed each fair use factor, the only question before this Court is whether the court below correctly held that the first factor...weighs in Goldsmith’s favor.”)

Hachette provides the classic example of this type of harm. There, the defendant offered “effectively the same product as” rightsholders—books—and made them available, in full, at no cost to consumers or libraries. *Id.* at 190. As the court put it, it is “difficult to compete with free.” *Id.* But complete, identical, copies are not required. *Google Books*, for example, found that copying to enable search for book contents was fair use only because the digital library’s “snippet view” produced “discontinuous, tiny fragments” of books that did not give searchers access to “effectively competing substitutes” for the books that Google had copied. 804 F.3d at 224. As the Second Circuit later noted, “the judgment [in *Google Books*] would likely have come out the other way if the copying had enabled the public to read substantial parts of the copied books.” *Romanova*, 138 F.4th at 117 n.9. Thus, courts considering whether GenAI models trained on copyrighted text qualify for fair use recognize that where the end product “could be used to generate significant portions” of the copyrighted works, factor four would cut in favor of the rightsholders. *Kadrey*, 788 F. Supp. 3d at 1051 (citing *Google Books*, 804 F.3d at 224).

Second is the harm to licensing markets. “It is indisputable that, as a general matter, a copyright holder is entitled to demand a royalty for licensing others to use its copyrighted work ... and that the impact on potential licensing revenues is a proper subject for consideration in assessing the fourth factor.” *Texaco*, 60 F.3d at 929. And where the copyright holder can exploit the copyrighted work in multiple licensing markets, the court should consider the effects in all those markets. *See, e.g., Warhol I*, 11 F.4th at 49–50 (separately analyzing harm to the market for magazine licensing of photographs, and harm to the market for licensing of “stylized derivatives” of photographs). The cognizable licensing markets include not just the markets in which the rightsholder currently participates, but also those that it might yet enter. *See, e.g., Castle Rock Ent., Inc. v. Carol Pub. Grp. Inc.*, 150 F.3d 132, 145–46 (2d Cir. 1998); *see also Thomson Reuters*

Enter. Ctr. GMBH v. Ross Intel. Inc., 765 F. Supp. 3d 382, 400 (D. Del. 2025) (“I must consider not only current markets but also potential derivative ones ‘that creators of original works would in general develop or license others to develop.’” (quoting *Campbell*, 510 U.S. at 592)).

Markets that may be considered under factor four must be “traditional, reasonable, or likely to be developed” so as to guard against the “vice of circular reasoning” that would result if courts could find harm simply because a copyright holder was not paid for a use that would not typically require a licensing fee. *Texaco*, 60 F.3d at 930–31. Thus, factor four disfavors fair use where there is a “workable” and “viable” market to obtain a license. *Texaco*, 60 F.3d at 930; *Tveyes*, 883 F.3d at 180 (factor four disfavored fair use because defendant usurped a “plausibly exploitable market” for access to copyrighted television content).

Third is the harm to the market for the same type of content as the Asserted Works—both the market for the publisher’s own body of works and the market for the broader category (here, news articles)—from unrestricted and widespread adoption of Defendants’ conduct. *See Hachette*, 115 F.4th at 193. The statute confirms that factor four reaches beyond harm from unauthorized copies. Not only does it direct courts to consider the use’s effect “upon the potential *market for...*the copyrighted work,” but it also directs courts to consider “the effect of the use upon the...*value of* the copyrighted work.” 17 U.S.C. § 107(4) (emphases added). The phrase “value of” has a broader meaning than “market for”—indeed, reading the two synonymously would violate the principle that words in a statute are to be given independent meaning, particularly when separated by the word “or.” *See United States v. Woods*, 571 U.S. 31, 45 (2013); Jane C. Ginsburg, *Fair Use Fair Factor Four Revisited: Valuing the “Value of the Copyrighted Work,”* 67 J. COPYRIGHT SOC’Y U.S.A. 19 (2020) (“[T]he statute’s designation of ‘the value of the copyrighted work’ identifies independent kinds of harm and entails considerations distinct from market substitution.”). A use

that devalues an entire genre of works necessarily affects the “value of the copyrighted work” within that genre as well.

The Second Circuit’s analysis in *Warhol I* reflects the breadth of harms captured by factor four. There, the Court did not just consider the harm to the market for Goldsmith’s photographs of Prince. Instead, it examined the harm to the “broader market”—the “market to license photographs of musicians, *such as* the Goldsmith Photograph, to serve as the basis of a stylized derivative image[.]” 11 F.4th at 50. By accounting for the harm in this market, the court guarded against the “risk[.]” of “disincentivizing artists from producing new work by decreasing its value—the precise evil against which copyright law is designed to guard.” *Id.*

Courts considering fair use in the AI training context have held that this type of harm plays a critical role in the factor four analysis. As *Kadrey* put it:

This case, unlike any of those cases [such as *Google Books* and *Perfect 10, Inc. v. Amazon.com, Inc.*], involves a technology that can generate literally millions of secondary works, with a miniscule fraction of the time and creativity used to create the original works it was trained on. No other use—whether it’s the creation of a single secondary work or the creation of other digital tools—has anything near the potential to flood the market with competing works the way that LLM training does....

Courts can’t stick their heads in the sand to an obvious way that a new technology might severely harm the incentive to create, just because the issue has not come up before. Indeed, it seems likely that market dilution will often cause plaintiffs to decisively win the fourth factor—and thus win the fair use question overall—in cases like this.

Kadrey, 788 F. Supp. 3d at 1055; *see also* United States Copyright Office, COPYRIGHT AND ARTIFICIAL INTELLIGENCE, PART 3: GENERATIVE AI TRAINING (May 2025) at 65–66 (“the fourth factor should not be read so narrowly,” and should account for harm that “stem[s] from AI models’ generation of material stylistically similar to works in their training data...[e]ven when the output is not substantially similar to a specific underlying work[.]”).

Indeed, *Kadrey* highlighted how potent this argument may be in the context of the news market. As Judge Chhabria explained, “markets for certain types of works (*like news articles*) might be even more vulnerable to indirect competition from AI outputs” than others, “present[ing] even stronger arguments against fair use.” *Kadrey*, 788 F. Supp. 3d at 1059 (emphasis added). Or, as Judge Chhabria explained elsewhere, “[a]n LLM that could generate accurate information about current events might be expected to greatly harm the print news market.” *Id.* at 1053. Beyond this, LLMs may also generate content that resembles news content, but in fact contains *inaccurate* information about current events—a phenomenon potentially even more harmful to the market for news. *See infra* Section IV.D.1.iv. They may even falsely attribute such content to news publishers. However considered, Judge Chhabria’s recognition that harm to the market for news may cause substantial, cognizable harm under factor four is correct and borne out by the evidence in this case.

Courts also sometimes consider, as part of the factor-four analysis, the “public benefits the copying will likely produce.” *Google*, 593 U.S. at 35. Importantly, however, the “public benefit” analysis is not a free-floating assessment of all theoretical benefits that might be derived from the copying. Instead, the public benefits that are cognizable are those that are related to the goals of copyright—specifically, the “creative production of new expression.” *Id.* at 35–36. And those benefits must be balanced against copyright-related losses, both to the rightsholders and to society more generally.

In *Hachette*, for example, the Second Circuit rejected the defendant’s invocation of “public benefits” from providing a “free digital library” of physical books because those benefits were “outweighed not only by harm to Publishers and authors but also by the long-term detriments society may suffer if [defendant’s] infringing use were allowed to continue.” 115 F.4th at 196. It found that the “long-term consequences” following from “unrestricted and widespread” use of

authors’ content would leave “little motivation to produce new works,” resulting in a “dearth of creative activity [that] would undoubtedly negatively impact the public,” a “reality that the Copyright Act seeks to avoid.” *Id.* at 195; *see also Associated Press v. Meltwater U.S. Holdings, Inc.*, 931 F. Supp. 2d 537, 553 (S.D.N.Y. 2013) (“Permitting Meltwater to take the fruit of AP’s labor for its own profit, without compensating AP, injures AP’s ability to perform this essential function of democracy”). Such an outcome would not only “decimate Publishers’ markets for the Works in Suit across formats,” *Hachette*, 115 F.4th at 195, but set off the “doom loop” that a Microsoft executive has said would imperil the future of AI itself.

1. Defendants’ generative AI models and products substitute for news.

Defendants’ products generate verbatim copies, summaries, and mimicry of Plaintiffs’ works because Defendants trained and grounded on those works. Users submit millions of queries to Defendants’ products seeking news, and unlike traditional search engines, the AI-generated outputs provide substitutive answers that reduce the need for users to visit Plaintiffs’ websites and flood the market with low-quality material that undermines the business model of news publishers.

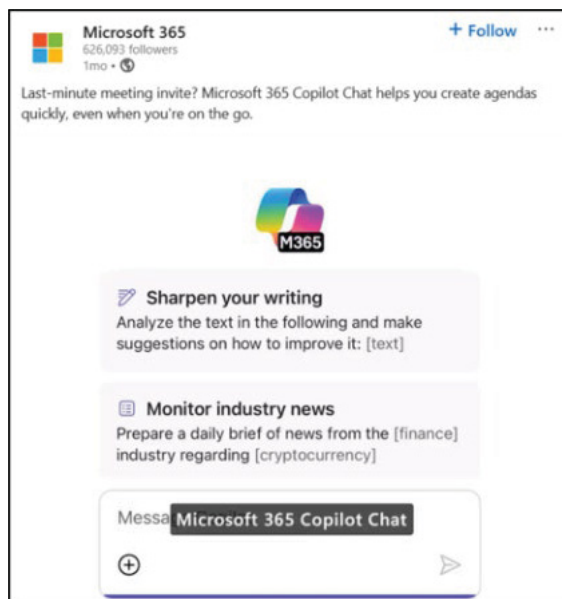

i) Defendants’ products output news content.

This case involves exactly the situation hypothesized in *Romanova* where “the copying ... enable[s] the public to read substantial parts of the copied [works].” 138 F.4th at 117 n.9. As demonstrated above in Section II.B, *supra*, Defendants’ models and products can and do produce outputs that contain verbatim copies of Plaintiffs’ asserted works as well as paraphrased copies and detailed summaries that are substantially similar to the asserted works themselves. SF942-970, 1053-1054, 1057-1074, 1078-1092, 1243-1256, 1422-1436.

Even where ChatGPT and Copilot outputs are not verbatim copies or summaries of Plaintiffs’ asserted works, training and grounding on those works is what enables models to substitute for news by reproducing the selection, coordination, and arrangement of the information

those works contain while emulating their expressive form and style. SF1425-36. This exploitation of copyrightable elements of Plaintiffs’ articles even without obvious regurgitation is why OpenAI’s Head of ChatGPT, concluded that Defendants’ “products are largely substitutive, period.” SF1473.

Users frequently seek news from Defendants’ products. SF1479-91. Their marketing confirms that this is a key use for ChatGPT and Copilot. Microsoft 365 Copilot Chat promoted its ability to “Monitor industry news” and “prepare a daily brief on news...”:

SF1492. Similarly, OpenAI’s ChatGPT Pulse offers to keep users “updated on local news”:

SF1496.

Defendants’ internal emails and documents also tout these capabilities. SF1423-430. For example, OpenAI noted that its models were “particularly good at predicting text of news articles,” “excellent at news,” and “very good at any news task.” SF1426-27. As early as 2020, OpenAI listed “News Generation” as one of GPT-3’s “skills.” SF1429. OpenAI also identified a “sample query” as “What’s the NYT saying today?” SF1430. A study by multiple OpenAI authors confirms that “seeking information,” defined as “searching for information about people, current events, products, and recipes,” accounts for 24% of ChatGPT’s usage in 2025. SF1522. Local news, an important aspect of the DNP’s business, has been described by OpenAI as a “pretty common quer[y]” in ChatGPT. SF1640. OpenAI’s expert admits that their products are used for news queries at least around [REDACTED] times per day. SF1487. Custom GPTs like “News Summarizer” and “Remove Paywall” confirm that this is a nontrivial use case. SF1470. Defendants do not dispute that the reason ChatGPT and Copilot are “good at news” is because they trained on stolen news content. SF1428.

ii) Defendants’ products do not drive traffic to sources.

The products are substitutive because they “reduce the need to visit websites” and “[w]ithout traffic, websites lose their revenue source.” SF1462. As Microsoft acknowledged: [REDACTED]
[REDACTED]
[REDACTED] SF1476. That’s why OpenAI understood that its systems posed an “existential threat” to publishers. SF1466. As an OpenAI software engineer stated, “no matter how prominently we show the links, users won’t click.” SF1475.

⁹“Search engine response page”—*i.e.*, a page of links to search results.

Defendants also acknowledge that ChatGPT, Copilot, and GenAI models aim to supplant traditional search. Sam Altman has called ChatGPT “a Google replacement.” SF1519. Microsoft’s survey expert reported that 37.2% of Copilot survey respondents would use “traditional web search inquiries” like Google in the “absence of a generative AI tool.” SF1515. The court in the government’s search monopoly case against Google rejected strong remedies because of emerging competition from GenAI. SF1518.

The replacement of search with GenAI harms publishers by producing **drastically lower** click-through rates (“CTRs”).¹⁰ SF1530-1537. As explained above, Plaintiffs are not required to prove harm empirically: common sense suffices. But Microsoft’s representative CTR data shows that the overall click-through rate reduction between Bing Chat and Bing Web Search was 87% to 93% for The Times’s websites, 83% to 91% for DNP’s websites, and 51% to 94% for ZD websites. SF1536. Such reductions in CTR clearly show substitution. *See AP v. Meltwater*, 931 F.Supp.2d at 554-55 (“Instead of driving subscribers to third-party websites,” minimal CTR shows “Meltwater News acts as a substitute for news sites...”).

Defendants’ own experts acknowledge that grounded LLMs exploit their sources rather than promote them like search uses that have been deemed fair use. As Microsoft’s economist expert Dr. Tucker explained:

Grounded general-purpose LLMs provide a similar service to search engines but produce different outputs. ... [S]earch engines typically return a ranked list of links, while grounded general-purpose LLMs generate stochastic output that synthesizes information from retrieved sources.

¹⁰ “Click-through rate” refers to the percentage of clicks from users to a given URL relative to the total impressions, which are the appearances of that URL in a search results page or within a chatbot’s response. SF1530.

SF1523. Defendants aren't shy about this fact. They advertise "fast, timely answers" instead of going to a search engine, SF570, 1526, and "instead of clicking through links, we can talk about whatever you're curious about." SF1524.

Defendants acknowledge the predictable consequences of this design. Per Microsoft, the "[p]romise of LLMs is largely in the same information work domains from which they get their content... They naturally compete with their content supply chain." SF1798. They substitute for the "labor of the people" who produced the original content on which they were trained, including, among other things, newspapers and books. SF1452, 1677. There is a "real risk" that GenAI could "significantly disrupt[] the employment of the very people who generated the data on which the foundation model was trained." SF1467. **LLMs are a product that destroys its supply chain.** SF1461.

iii) Defendants' products generate pink slime.

Another way that Defendants' accused products substitute for news is by enabling the generation of high volumes of "pink slime," which is unreliable low-quality content that is often either plagiarized or remixed from legitimate news sources. SF1683-1684. Defendants' accused products have made pink slime news content farms cheaper, easier to make, and harder to detect. SF1686. Using OpenAI's published API pricing, it would cost roughly \$6,800 to generate one million news-style articles averaging 500 words each – and would require no human author, editor, or reporter to do so. SF1491.

The proliferation of GenAI pink slime news content is harmful to journalism because it undermines the business model of news publishers by diluting the market with a flood of low-quality inauthentic news material, publishing plagiarized content, and siphoning away readers and advertising money. SF1703, 1706-1709. For example, Prism News operated 200 AI-generated publications posing as local newsrooms and hobby sites, with only four employees. SF1710.

Rather than conduct any form of reporting, Prism used GenAI to summarize existing articles and repackaging them as “new” stories competing in the original articles’ markets. SF1711. Prism News is but one example of why the “concept of market dilution becomes highly relevant” to the consideration of fair use when GenAI tools are at issue. *Kadrey*, 788 F.Supp.3d at 1055.

Defendants knew about and anticipated that their accused products would proliferate and spread pink slime, and that GenAI pink slime news articles were often indistinguishable to readers from original content. SF1683-1712.

iv) Defendants’ products diminish demand for Plaintiffs’ content.

Plaintiffs have already begun to experience the effects of Defendants’ products on the market for news. Surveys show that Plaintiffs’ subscribers are aware of and starting to use GenAI tools. SF1579-1595. Former DNP digital subscribers are [REDACTED] more likely and former print subscribers are [REDACTED] more likely to use GenAI tools than active digital and active print subscribers respectively. SF1594. Among Times subscribers who were surveyed who used or paid for ChatGPT for news, 36% responded that their use of ChatGPT “means I no longer need news from the New York Times at all.” SF1581.

DNP has experienced declining search referrals and revenue since ChatGPT launched in 2022. SF1609-1625.

ZD has experienced the same pattern. ZD invests heavily in search-engine optimization, advertising, and other efforts designed to increase monetizable traffic to its properties, but those monetization efforts have been undermined by declines in traffic and revenues attributable to Generative AI answer engines. SF1626. Cloudflare’s CEO cited data showing the ratio of webpages scraped to visitors sent: in 2015, Google scraped two pages for every visitor (2:1); by June 2025, that ratio was 18:1 for Google and 1,500:1 for OpenAI. SF1540.

CIR and The Intercept, nonprofit news organizations, likewise depend on search traffic to acquire donations and grants to support their mission. SF104-110. That traffic has shrunk because of GenAI products and is likely to shrink further. SF1627-1628.

Further, when Defendants' use captures that scarce audience and attention using Plaintiffs' own content, there is not only less demand for Plaintiffs' content in their own platforms, but also less demand within their paying licensees' distribution channels and platforms. SF1629-1634.

2. Defendants' uses supersede feasible licensing markets.

Defendants' uses of Plaintiffs' copyrighted works also harm the existing and likely market for licensing news content for use in LLM training and RAG. Defendants took Plaintiffs' works for free even though they pay license fees to other publishers for the same kind of content and for the same uses. SF147-206, 207-228. This is a well-recognized theory of harm. *Campbell*, 510 U.S. at 590, 592; *Hachette*, 115 F.4th at 194.

The market for licensing data for LLM training and RAG already exists.¹¹ SF135-141. In fact, Defendants helped build it. SF147-206, 207-228. OpenAI has entered into at least [REDACTED] Media Publisher Agreements ("MPAs") that provide for [REDACTED] [REDACTED]. SF141, 147-151. Annual payments under the [REDACTED] vary widely, from [REDACTED] [REDACTED] SF149. The licensed content under the MPAs comprises textual content, largely in the form of articles, and includes both historical archives as well as ongoing or updated content. SF150. Similarly, Microsoft has entered into at least [REDACTED]

¹¹ Even Defendants' experts acknowledge that this market exists, or is, at minimum, "developing," which exceeds the "likely to be developed" standard in *Texaco*, 60 F.3d at 930. *See* SF136 (Microsoft's expert Dr. Tucker admitting that these "licensing collectives and marketplaces for data for training or grounding LLMs" are "developing"); SF138 (Microsoft's economic expert Dr. Rao using real-world data licenses for LLM training and RAG to inform his market approach calculations for News Plaintiffs' damages).

[REDACTED]

[REDACTED]. SF207. [REDACTED]

[REDACTED] SF146.

Third parties are paying to license this type of content for use in GenAI tools. For example, Amazon has entered into at least 23 “Data Service Agreements” (DSAs) which have generally granted Amazon a license to reproduce, modify, prepare derivative works based upon, and otherwise use and exploit the Provider Data for purposes relating to, inter alia, GenAI activities. SF247-273. Additional GenAI providers, including Google, Meta, Perplexity, ProRata.ai, and Mistral AI, have entered agreements with news publishers. SF274. Companies such as TollBit, Cloudflare, Credent, ProRata, ScalePost, Human Native AI, Copyright Clearance Center, Dappier, Defined.ai, Goodrights, Valyu, Personal Digital Spaces, and Calliope Networks connect publishers with GenAI companies to monetize digital data. SF275-290. Yet rather than pay Plaintiffs royalties to access their copyrighted “crown jewels,” SF1651, as they have repeatedly done for other publishers, SF147-206, 207-228, Defendants chose to “‘hoover[]’ up” Plaintiffs’ copyrighted content for free. SF1437.

3. Widespread and unrestricted adoption of Defendants’ conduct would severely harm the market for news along with AI itself.

There is no doubt about “what would happen” if Defendants’ conduct were to become widespread and unrestricted—because it already is happening. One effect of ChatGPT’s release in November 2022 was to spark other companies like Google to fast-track their own GenAI products, including, most significantly, Google’s AI Overviews. SF1779. “Today,” Microsoft admits, “most LLMs (including those from OpenAI) are built on millions of scraped webpages and other large text datasets, and almost none of this content has been obtained with its owners’ knowledge or consent.” SF1778.

Defendants’ own experts admit that Plaintiffs have been harmed by Google AI Overviews having followed Defendants’ lead. SF1781-1788. OpenAI’s economic expert Dr. Stamm opined that users who view content via Google AI Overviews are less likely to click on a link. SF1782. Another OpenAI economic expert, Dr. Goldfarb, opined: “I find that the decline in referral traffic to The Times’s properties has been driven by a combination” of factors including “e.g., Google AI Overviews.” SF1784, 1786. Dr. Goldfarb also opined that “Google’s introduction of AI overviews may have depressed search referrals by 20 to 60 percent” for DNP. SF1785. Dr. Sinnreich, OpenAI’s media expert, opined based on a 2026 Reuters Institute analysis that “referral traffic to publishers from both Google Search and Google Discover has dropped considerably (from over 5 billion monthly referrals via Discover to fewer than 4 billion, and from well over 3 billion via Search to slightly more than 2 billion) since Google introduced AI overviews.” SF1787. Dr. Sinnreich also admitted that declines in Google referrals are related to AI-generated summaries, among other things. SF1788.

The harm flowing from unrestricted and widespread adoption has already begun. OpenAI understood that its technology poses an “existential threat” to publishers as early as June 2023. SF1466. Microsoft has observed that “threaten[ing] the economic foundations of its essential suppliers ... is an inherent outcome of creating LLMs with our current content strategy: LLMs are useful because they replicate the patterns in their training content which, without ways of distributing economic value down the content supply chain, necessarily threatens the economic sustainability of those who create the content.” SF1672.

Yet AI companies remain powerless to break out of this “doom loop” because, while the industry as a whole would benefit if every company paid to sustain the continued production of the creative works their technology depends on, each individual company is better off taking

content for free while others pay. Finding that copying news for AI is not fair use would solve this prisoners' dilemma by putting all AI companies, OpenAI and Microsoft included, on an even footing. As Microsoft's Dr. Glen Weyl put it, compensating creators is "in the best interests of my employer, of my country, and of many other groups I belong to." SF1657. An illustration from a Microsoft document that is worth a thousand words shows why:

Argument from Data Leverage literature: We tech folks might think we're the entire world, but content creators are Archimedes.

SF1817.

E. None of the uses at issue in this case are fair.

To sum up, all statutory factors weigh against Defendants' affirmative defense of fair use for each copy that Defendants made of Plaintiffs' articles.

- **Acquisition:** Deceptively scraping expressive works, often from behind paywalls and in violation of terms of service and other restrictions or obtaining them from

unlicensed third-party scrapers to curate a general-purpose repository without paying the usual costs of acquisition has no fair use justification.

- **Training:** Copying Plaintiffs’ articles to train models was not fair use because doing so was admittedly unnecessary to realize any general capabilities but was done instead to serve commercially valuable news-seeking use cases that substitute for those articles.
- **Grounding:** Microsoft’s copying of Plaintiffs’ articles to respond to user queries self-evidently substitutes for the articles it copied.
- **Output:** Microsoft’s delivery of copies or recognizable derivatives of copyrighted works to the public in Copilot outputs that do not generate significant referral traffic lacks any fair use purpose.
- **“Horse Trading”:** Defendants’ copying of Plaintiffs’ content to “horse trade” it with each other is just as obviously not fair use.

V. The Court should grant summary judgment to plaintiffs on the first three elements of their DMCA claims.

The DMCA was enacted “to strengthen copyright protection in the digital age,” “combat copyright piracy,” and provide “broad protections to copyright owners.” *N.Y. Times Co. v. Microsoft Corp.*, 777 F. Supp. 3d 283, 312 (S.D.N.Y. 2025); *Mango v. BuzzFeed, Inc.*, 970 F.3d 167, 172 n.2 (2d Cir. 2020). A violation of section 1202(b)(1) requires: (1) conveyance of copyright management information (“CMI”) in connection with a copy of a work, (2) removal or alteration of CMI without authority of the copyright owner or the law, (3) that the removal was intentional, and (4) knowledge or reasonable grounds to know that removal would likely induce, enable, facilitate, or conceal an infringement. 17 U.S.C. § 1202(b)(1); *Mango*, 970 F. 3d at 171. Copyright registrations are not required, as OpenAI conceded in its Answer. *See Gattoni v. Tibi*,

LLC, 254 F. Supp. 3d 659, 663-64 (S.D.N.Y. 2017); OpenAI Answer to CIR Second Amend. Compl. ¶ 9, Dkt. 1652.

Plaintiffs seek summary judgment on the first three elements, which will streamline the issues for trial. Fed. R. Civ. P. 56(g).

A. Plaintiffs conveyed CMI in connection with copies of their Asserted Works.

CMI includes the title, notice of copyright, author, publisher, and terms of use. 17 U.S.C. § 1202(c)(1)-(6). Links to CMI qualify. 17 U.S.C. § 1202(c)(7).

Courts interpret “conveyed in connection with” “in its broadest sense.” *Janik v. SMG Media, Inc.*, 2018 WL 345111, at *12 (S.D.N.Y. Jan. 10, 2018) (quoting S. Rep. 105-190 at 35 (1998)). Thus, CMI need not be placed in close “[p]hysical proximity” to the work. *Pierson v. Infinity Music & Ent., Inc.*, 300 F. Supp. 3d 390, 396 (D. Conn. 2018). CMI at the top or the bottom of a webpage, including a copyright notice and a link to terms of use, is conveyed in connection with a work when it is “easily accessible in conjunction with” the work. *Id.* at 391-92, 396. Plaintiffs published their CMI either directly above the article (for author and title information) or in an easily accessible website footer (for copyright notice and terms of use information), thus conveying CMI “in connection with” copies of their Asserted Works. SF1257-1284.

CMI must be conveyed in connection with “copies” of the work. 17 U.S.C. § 1202(c). The Copyright Act defines “copy” in 17 U.S.C. § 101. This definition is satisfied by substantial similarity. *Knitwaves, Inc. v. Lollytogs Ltd. (Inc.)*, 71 F.3d 996, 1002 (2d Cir. 1995). And the standard definition applies to “copies” in the definition of CMI. *See ADR Int’l Ltd. v. Inst. for Supply Mgmt. Inc.*, 667 F. Supp. 3d 411, 427 (S.D. Tex. 2023). That definition is satisfied here because the copies from which OpenAI removed Plaintiffs’ CMI are either (1) raw copies it downloaded from Plaintiffs’ websites, or (2) exact/near-exact replicas of those copies it obtained

from Common Crawl. SF809, 814-819, 823, 1190-1191, 1263-1264, 1273-1275, 1281-1284, 1300-1301, 1360. Because the copies are identical or nearly identical, they are substantially similar.

B. OpenAI removed Plaintiffs’ CMI without authority.

OpenAI removed CMI from Plaintiffs’ Asserted Works without Plaintiffs’ permission. SF1285-1299. Common Crawl scraped exact copies of Plaintiffs’ websites with their CMI, and OpenAI downloaded the entire raw files from Common Crawl. SF814-819, 1263-1264, 1273-1275, 1281-83. When OpenAI obtained those copies, they contained Plaintiffs’ CMI. SF1257-1284. But CMI was systematically absent from the copies in OpenAI’s training sets. SF1361-1421. Though true of all CMI fields, this is especially pronounced for copyright notice and terms of use information, which OpenAI essentially never preserved. SF1381-1407, 1417-1420. For example, The Intercept’s copyright notice is absent from *every* copy in OpenAI’s training sets, and Mother Jones’s is absent in 99.99 percent of cases. SF1417-1418. Similarly, The Times’s copyright notice is absent in 99.9 percent of cases; and DNP’s copyright notice is absent in 100 percent of cases for five of the plaintiffs, and at least 99.4 percent for the remainder. SF1381-1389. ZD’s copyright notice was stripped 99.8 percent of the time. SF1395, 1397-1398.

In creating training-set copies of the Asserted Works, OpenAI removed CMI using text extractors—Dragnet, Newspaper, and Gutentag—designed to remove CMI. SF1307-1308, 1333-1344. These extractors target removal of CMI-related terms like “byline,” “copyright,” and “©,” particularly where those terms appeared as CMI. SF1310-1315, 1317-1322, 1325-1332. For instance, in Asserted Works about copyright-related issues, the text extractors removed copyright notices, including the word “copyright,” but retained the word “copyright” in the body of the article. SF1330-1331. OpenAI employees described the process as “removing” “boilerplate,”

which they understood to include CMI fields. SF1304, 1347-1350, 1354, 1357. OpenAI’s expert agreed. SF1304, 1349-1351.

OpenAI removed Plaintiffs’ CMI at a massive scale:

Plaintiff	Number of Copies of Asserted Works from which OpenAI’s Removed at Least One Piece of CMI
The Times	3,002,796 (SF1363)
DNP	2,638,497 (SF1365-1380)
The Intercept	46,142 (pieces of CMI) 13,353 (copies) (SF1412-1413)
CIR	370,993 (pieces of CMI) 101,092 (copies) (SF1415-16)
ZD	3,462,149 (SF1395)

C. OpenAI’s removal was intentional.

Intent exists when a defendant intentionally uses computer programs that are designed to remove information that qualifies as CMI. *N.Y. Times*, 777 F. Supp. 3d at 315. There is no dispute that OpenAI did exactly that. That is among the very purposes of its text extractors, as confirmed by OpenAI’s employees and experts, who stated in documents and testimony that OpenAI removed content it did not want its model to output or be trained on, including CMI. SF1303-1304, 1346-1359. OpenAI employees admitted that they removed text that OpenAI “wouldn’t want the model to be outputting,” including “copyright notices.” SF1357-1358. They also admitted that links to terms of service “would not be something that [OpenAI] would want inputted into the model.” SF1359. And Dr. Callison-Burch testified that a byline is not “readable human language” “of the sort that is typically desired for LLM pretraining.” SF1355.

VI. Plaintiffs are entitled to separate awards of statutory damages for infringement of each article.

A court may award statutory damages “for all infringements involved in the action, with respect to any one work[.]” 17 U.S.C. § 504(c)(1). As discussed above, *see* Section III.A, each of

The Times's, DNP's, and CIR's Asserted Works and some ZD works were published in a newspaper or periodical issue for which they secured a timely copyright registration, and registration of the issue covers the individual articles. *Morris*, 259 F.3d at 68; U.S. Copyright Office, Circ. 62A at 2; 17 U.S.C. § 412.

In the Second Circuit, whether statutory damages are awarded for each individual work (article), or only on the collective work (issue), depends on whether, as of the date of infringement, the individual work was made available separately from the collective work. That is,

[W]hen a copyright holder or publisher issues material *on an independent basis*, the law permits a statutory damages award for each individual work.... In other words, our focus is on whether the plaintiff—the copyright holder—issued its works separately, or together as a unit....For these reasons, we conclude that the District Court properly allowed separate statutory damages awards for songs that the plaintiffs issued as singles, even if those songs were also made available on albums.

EMI Christian Music Grp., Inc. v. MP3tunes, LLC, 844 F.3d 79, 101 (2d Cir. 2016) (emphasis added). The Court approved the jury instruction that, “so long as the plaintiffs proved that ‘on the date of infringement, each individual [song] at issue in this case was available for purchase as a single [work],’ it could issue multiple statutory damages awards for singles that appeared on the same album.” *Id.*

The Asserted Works (articles) are produced and available for consumption as single works separate and apart from any issue in which they appear. At the time of first infringement in this case (SF139, 142-143), each article was available online for reading and downloading separate from the “issue” in which the article also appeared. SF441, 460-462. OpenAI’s expert admitted that by the late 1990s (at least 20 years before Defendants’ alleged infringement began), users “could access individual articles online without having to buy a whole edition of a newspaper” and “began consuming content at the individual piece level”. SF442. The uncontested record

establishes that the Court should enter summary judgment that statutory damages, if awarded, should be on a per-article basis.

VII. The Court should grant summary judgment on Defendants’ remaining affirmative defenses.

In addition to fair use, Defendants have raised a litany of other affirmative defenses. *See* CMC Statement Exhibit A – Case Information, Dkt. 47-1. Under *Celotex*, Plaintiffs contend that Defendants have not provided evidence establishing these defenses. *See Celotex Corp. v. Catrett*, 477 U.S. 317, 325 (1986); *Tardif v. City of New York*, 991 F.3d 394, 403 (2d. Cir. 2021). The Court should therefore grant summary judgment to Plaintiffs on all of them.

VIII. Conclusion

The Court should grant summary judgment for Plaintiffs on (1) their *prima facie* claims of infringement by (a) acquiring, (b) training on, (c) grounding on (by Microsoft), (d) outputting (by Microsoft), and (e) “horse trading” their asserted works; (2) Defendants’ affirmative defense of fair use for any of these infringements; (3) the elements of conveyance of CMI and its intentional removal without authority under the DMCA; (4) Plaintiffs’ entitlement to separate awards of statutory damages for each infringed article published in their newspapers and periodicals; and (5) Defendants’ remaining affirmative defenses.
